Introduction and Quick Start

The Hemisphere GNSS Technical Reference Manual (TRM) is a resource for software engineers and system integrators to configure GNSS receivers. It may also be useful to persons with knowledge of the installation and operation of GNSS navigation systems.

The TRM includes information on GNSS technology and platforms, general operations of receiver, and the commands and messages you need to operate your receiver and/or other HGNSS hardware.

Use the following links to navigate quickly throughout the contents of this manual:

- **Quick Start** - the basic information you need to get started using your Hemisphere GNSS receiver.
- **GNSS Technology and Platforms** - an overview the GNSS engine, satellite tracking information, positioning, accuracy, and update rates of NMEA 0183 and binary messages.
- **DGNSS Solutions**
- **Receiver Operation** introduces general operational features of the receiver operation modes, and default operation parameters.
- **Commands and Messages** are grouped by type (General, GNSS, e-Dif, Data, RAIM, etc.). You can find a listing of all commands in the Commands and Message table. For a more detailed description of each message and command, click the link to navigate to that specific command or message.
- **Firmware**
- **Resources** provides resources for additional information.
- **Change History** lists all the topics in this manual along with the latest update description and change date.
- **Troubleshooting** provides troubleshooting advice for common questions.

No part of this manual may be reproduced, transmitted, transcribed, stored in a retrieval system or translated into any language or computer language, in any form or by any means, electronic, mechanical, magnetic, optical, chemical, manual or otherwise, without the prior written permission of Hemisphere GNSS.
Quick Start

Quick Start contains basic information to get you started using your Hemisphere GNSS receiver.

What is my receiver type? Send the JHTYPE,SHOW command.

How do I load firmware onto my receiver, and why would I do this?
To load firmware, use RightARM.
Loading firmware allows you to run application specific capabilities.

What is my current receiver configuration?
Send the JSHOW query.

What is my Vector receiver configuration?
Send the JATT, SUMMARY query.

What commands are supported by my receiver?
First, send the JHTYPE, SHOW command to identify the GNSS engine in your receiver.
Then, go to the Overview (?) topic for a list of commands supported by that GNSS engine.

Overview topic for commands supported by that GNSS engine.

How do I send a command to my receiver?
Connect your receiver to a PC and use a terminal program (i.e., HyperTerminal), or Hemisphere GNSS’ PocketMax, or SLXMon. For more information, refer to the User Guide for your product. User Guides can be found on the Hemisphere GNSS website.

How do I turn on data messages (such as GPGGA) for a receiver?
See Configuring the Data Message Output.

Topic Last Updated: v1.11 / November 15, 2018
GNSS Technology and Platforms

GNSS Engine Overview

The GNSS engine is always operating regardless of the DGNSS mode of operation. The following sections describe the general operation of the receiver.

- Satellite Tracking
- Positioning Accuracy
- Update Rates

Both the GNSS and SBAS operation of the receiver module feature automatic operational algorithms. When powered for the first time, the receiver system performs a "cold start," which involves acquiring the available GNSS satellites in view and the SBAS differential service. To do this, the receiver needs a compatible GNSS antenna connected that offers a relatively clear, unobstructed view of the sky. While you can often achieve this indoors with an antenna placed against a window, you may need to place the antenna outside (i.e., on a roof or a short distance away from the building).

If SBAS is not available in a particular area, an external source of RTCM SC-104 differential correction may be used. If an external source of correction data is needed, the external source needs to support an eight data bit, no parity and one stop bit configuration (8-N-1). See also SBAS Overview.

Topic Last Updated: v1.07 / February 16, 2017
Satellite Tracking

The receiver automatically searches for GNSS satellites, acquires the signal, and manages the associated navigation information required for positioning and tracking. This is a hands-free mode of operation. Satellite acquisition quality is described as a signal-to-noise ratio (SNR). The higher the SNR, the better the signal reception quality. SNR information is provided by the receiver through the use of NMEA 0183 data messages available via its multiple serial ports.

Positioning Accuracy

The receiver is a sub-meter product with 95% horizontal accuracy under ideal conditions.

To determine the positioning performance of the receiver, Hemisphere GNSS gathers a 24-hour data set of positions in order to log the diurnal environmental effects and full GPS constellation changes. Data sets shorter than 24 hours tend to provide more optimistic results.

The horizontal performance specification of 95% accuracy is, as stated above, based on ideal conditions. In reality, obstruction of satellites, multipath signals from reflective objects, and operating with poor corrections will detract from the receiver’s ability to provide accurate and reliable positions. Differential performance can also be compromised if the receiver module is used in a region without sufficient ionospheric coverage.

Further, if external corrections are used, the baseline separation between the remote base station antennas can affect performance.

The estimated positioning precision is accessible through the use of NMEA 0183 command responses as described in the commands and messages documentation.

Because the receiver cannot determine accuracy with respect to a known location in real time (traditionally performed in post-mission analyses), the precision numbers are relative in nature and are only approximates.
Update Rates

The update rate of each NMEA 0183 and binary message of the receiver can be set independently with a maximum that is dependent upon the message type. For example, some messages have a 1 Hz maximum while other messages have a 50 Hz maximum. The higher update rates, such as 20 Hz, are an option and can be obtained with an additional subscription.

Higher update rates are valuable for applications where:

- Higher speeds are present such as in aviation
- You have manual navigational tasks such as in agricultural guidance
- You have an automated or autonomous navigational task such as in robotics or machine control.

Keep the following in mind regarding message rates:

- Some messages can only be OFF or ON (0 or 1Hz) Example: $JASC,RTCM3,1
- Some messages can only be 0 or 1 Hz, but will come out once first, then only if they change Example: $JASC,BIN95,1
- Messages that are available at other rates can be set to rates SLOWER than 1 Hz (see Note 1 below) Example: $JASC,GPGGA,0.1
- If the receiver is subscribed to 10 or 20Hz, the receiver can log at rates FASTER than 1 Hz (See Note 2 below) Example: $JASC,GPGGA,5

Note 1: Slower than 1 Hz.

Use the following guidelines:

<table>
<thead>
<tr>
<th>To log once every x seconds</th>
<th>Use JASC,xxxx,</th>
</tr>
</thead>
<tbody>
<tr>
<td>2</td>
<td>0.5</td>
</tr>
<tr>
<td>3</td>
<td>0.3333</td>
</tr>
<tr>
<td>4</td>
<td>0.25</td>
</tr>
<tr>
<td>5</td>
<td>0.2</td>
</tr>
<tr>
<td>6</td>
<td>0.1667</td>
</tr>
<tr>
<td>7</td>
<td>0.1429</td>
</tr>
<tr>
<td>8</td>
<td>0.125</td>
</tr>
<tr>
<td>9</td>
<td>0.1111</td>
</tr>
<tr>
<td>10</td>
<td>0.1</td>
</tr>
<tr>
<td>15</td>
<td>0.0667</td>
</tr>
<tr>
<td>20</td>
<td>0.05</td>
</tr>
<tr>
<td>25</td>
<td>0.04</td>
</tr>
<tr>
<td>40</td>
<td>0.025</td>
</tr>
<tr>
<td>50</td>
<td>0.02</td>
</tr>
<tr>
<td>100</td>
<td>0.01</td>
</tr>
<tr>
<td>120</td>
<td>0.0083</td>
</tr>
</tbody>
</table>

Rates not listed above may be possible, but may not log on integer seconds. Users should test to see if the results are acceptable for their application.

Note 2: Faster than 1Hz, if subscribed.
For traditional firmware support is 20 Hz. Acceptable rates are 1, 2, 4, 5, 10 or 20 Hz. Using rates other than those listed will result in data appearing in a rate similar to the rate requested, but the data times will be quantized to 0.05 second resolution. This is due to the receiver’s internal computing rate of 20 Hz. Time resolution is 0.05 seconds even if the receiver is only subscribed for 10 Hz data. Quantizing may result in a slightly different number of messages per minute than expected. For example, 3 Hz data produces approximately 172 messages per minute due to quantizing, instead of the expected 180 messages.

Some products and firmware support 50 Hz. Acceptable rates are 1, 2, 5, 10, 25, or 50. Using rates other than a factor of 20 Hz may result in quantized data. Regardless, the data in the message is referenced to the time of the message.

Topic Last Updated: v1.11 / November 15, 2018
Hemisphere GNSS Hardware Platforms

Hemisphere GNSS offers many hardware platforms, some of which include:

- Positioning OEM boards and receivers
- Heading OEM boards and receivers
- Beacon OEM boards

Topic Last Updated: v1.11 / November 15, 2018
Universal Development Kit

The Universal Development Kit allows you to integrate a Hemisphere GNSS OEM board into your design and includes the following:

- Main carrier board
- Adapter board
- Power cable and AC power supply
- Serial data cable, power cable and AC power supply, ethernet cable, serial cable null modem, USB-C to USB-A cable-

The Universal Development Kit supports the following Hemisphere GNSS OEM boards:

- Phantom 20
- Phantom 34
- Phantom 40
- Vega 28
- Vega 40
- Vega 60
- Crescent 206
- Crescent P207

Depending on the Hemisphere GNSS OEM board you purchase with your Universal Development Kit, an Integrator Guide is available for download from the Hemisphere GNSS website.

DGNSS and RTK Solutions

SBAS

SBAS Overview

The following topics describe the general operation and performance monitoring of the Space-Based Augmentation System (SBAS) demodulator within the receiver module:

- SBAS Automatic Tracking
- SBAS Performance
- WAAS DGPS
- WAAS Signal Information
- WAAS Reception
- WAAS Coverage

Topic Last Updated: v1.00 / August 11, 2010
SBAS Automatic Tracking

The SBAS demodulator featured within the receiver automatically scans and tracks multiple SBAS satellite signals, as specified by the JWAASPRN command (defaulted to WAAS PRN 135 and 138, suitable for use in North America).

If the default satellites become disabled, the receiver automatically tracks different satellites. This automatic tracking enables you to focus on other aspects of your application rather than ensuring the receiver is tracking SBAS correctly.

The SBAS demodulator features two-channel tracking that enhances the ability to maintain acquisition on an SBAS signal satellite in regions where more than one satellite is in view. This redundant tracking approach results in more consistent signal acquisition in areas where signal blockage of either satellite is possible.

Topic Last Updated: v1.11 / November 15, 2018
SBAS Performance

SBAS performance is described in terms of bit error rate (BER). The SBAS receiver requires a line of sight to the SBAS satellite to acquire a signal.

The BER number indicates the number of unsuccessfully decoded symbols in a moving window of 2048 symbols. Due to the use of forward error correction algorithms, one symbol is composed of two bits. The BER value for both SBAS receiver channels is available in the RD1 message.

A lower BER indicates data is being successfully decoded with fewer errors, providing more consistent throughput. The BER has a default no-lock of 500 or more. As the receiver begins to successfully acquire a signal, a lower BER results. For best operation, this value should be less than 150 and ideally less than 20.

SBAS broadcasts an ionospheric map on a periodic basis and it can take up to five minutes to receive the map on startup. Until it downloads the SBAS map the receiver uses the broadcast ionosphere model, which can result in a lower performance compared to when the map has been downloaded. This is the case for any GNSS product supporting SBAS services.

Topic Last Updated: v.1.11/November 15, 2018
**WAAS DGPS**

SBAS services take in reference data from a network of base stations to model the sources of error directly, rather than computing the sum impact of errors upon observed ranges. The advantage of this approach is that the error source can be more specifically accounted for during the correction process.

Specifically, WAAS calculates separate errors for the following:

- Ionospheric error
- GPS satellite timing errors
- GPS satellite orbit errors

Provided that a GNSS satellite is available to the WAAS reference station network for tracking purposes, orbit and timing error corrections will be available for that satellite. Ionospheric corrections for that satellite are only available if the signal passes through the ionospheric map provided by WAAS, which covers most of North America.

To improve the ionospheric map provided by WAAS, the receiver extrapolates information from the broadcast ionospheric coverage map, extending its effective coverage. This allows the receiver to be used successfully in regions that competitive products may not. This is especially important in Canada for regions north of approximately 54° N latitude and for outer regions of the Caribbean.

The process of estimating ionospheric corrections beyond the WAAS broadcast map is not as good as having an extended WAAS map and accuracy degradation may occur.

The map links below depict the broadcast WAAS ionospheric correction map and the Hemisphere GNSS extrapolated version, respectively. As the two maps show, the Hemisphere GNSS extrapolated version's coverage is greater in all directions, enhancing usable coverage.

- Broadcast WAAS ionospheric correction map
- Extrapolated WAAS ionospheric correction map
WAAS Signal Information

WAAS and other SBAS systems transmit correction data on the same frequency as GPS, allowing the use of the same receiver equipment used for GPS. Another advantage of having WAAS transmit on the same frequency as GPS is that only one antenna element is required.

Topic Last Updated: v1.00 / August 11, 2010
WAAS Reception

Since WAAS broadcasts on the same frequency as GPS, the signal requires a line of site in the same manner as GPS to maintain signal acquisition.

Because of their locations, SBAS satellites may appear lower on the horizon than GPS satellites—it depends on the geographic position on land. When using WAAS correction data, the receiver can provide the azimuth and elevation of all satellites to aid in determining their position with respect to the antenna.

Topic Last Updated: v1.00 / August 11, 2010
WAAS Coverage

The figure below depicts the current WAAS coverage provided by the geostationary satellites.

The WAAS satellites are identified by their pseudo-range-number (PRN). In some areas, two or more satellites may be visible.

Note: Signal coverage may be present in some areas without either sufficient ionospheric map coverage or satellites with valid orbit and clock corrections. In such cases performance may be degraded compared to areas fully covered by the WAAS ionospheric coverage.

Topic Last Updated: v1.00 / August 11, 2010
EGNOS

The European Geostationary Navigation Overlay Service (EGNOS) uses multiple geostationary satellites and a network of ground stations to transmit differential correction data for public use. EGNOS is currently located over the Atlantic Ocean and Africa.

Because of their location over the equator, these satellites may appear lower over the horizon as compared to GPS satellites - depending upon the geographic position on the land. In regions where the satellites appear lower on the horizon, they may be more susceptible to being masked by terrain, foliage, buildings or other objects, resulting in signal loss. Increased distance from the equator and the satellite's longitude cause the satellite to appear lower on the horizon.

The figure below shows approximate EGNOS coverage provided by the satellites. Virtually all of Europe, part of Northern Africa, and part of the Middle East is covered with at least one signal. Most of Europe is covered by three signals.
**MSAS**

The MTSAT Satellite-based Augmentation System (MSAS) is currently run by the Japan Meteorological Agency (JMA). MSAS provides GPS augmentation information to aircraft through MTSAT (Multi-functional Transport Satellite) located approximately 36000 km above the equator (geostationary earth orbit).

MSAS generates GPS augmentation information by analyzing signals from GPS satellites received by monitor stations on the ground. This augmentation information consists of GPS-like ranging signal and correction information on GPS errors caused by the satellites themselves or by the ionosphere.

The MSAS signal provides accurate, stable, and reliable GPS position solutions to aircraft, resulting in a considerable improvement in the safety and reliability of GPS positioning. This enables aviation users who are under very strict safety regulations to use GPS positioning as a primary navigation system.

Topic Last Updated: v1.00 / August 11, 2010
GAGAN

The GPS Aided Geo Augmented Navigation system (GAGAN) was deployed by the Indian government. It operates similarly to the other SBAS regions described previously and will broadcast on one geostationary satellite (PRN 127) over the Western portion of the Indian Ocean. GAGAN is visible in India at elevation angles in excess of 50° above the horizon. This provides an excellent correction source in virtually all areas of the subcontinent.

Radiobeacon

Radiobeacon Range

The broadcasting range of a 300 kHz beacon depends on a number of factors, including:

- Transmission power
- Free space loss
- Ionospheric state
- Surface conductivity
- Ambient noise
- Atmospheric losses

Signal strength decreases with distance from the transmitting station, mostly due to spreading loss. This loss is a result of the signal’s power being distributed over an increasing surface area as the signal radiates away from the transmitting antenna.

The expected broadcast range also depends on the conductivity of the surface over which it travels. A signal will propagate further over a surface area with high conductivity than over a surface with low conductivity.

Lower conductivity surfaces, such as dry, infertile soil, absorb the power of the transmission more than higher conductivity surfaces, such as sea water or arable land.

A radio beacon transmission has three components:

1. Direct line-of-sight wave

The line-of-sight wave is insignificant beyond visual range of the transmitting tower and does not have a substantial impact upon signal reception.

2. Ground wave

The ground wave portion of the signal propagates along the surface of the earth, losing strength due to spreading loss, atmospheric refraction and diffraction, and attenuation by the surface over which it travels (dependent upon conductivity).

3. Sky wave

Depending on its reflectance, this skyward portion of the beacon signal may bounce off the ionosphere and back to Earth, causing reception of the ground wave to fade. Fading—which may cause reception to fade in and out—occurs when the ground and sky waves interfere with each other. This problem usually occurs in the evening when the ionosphere becomes more reflective and usually on the edge of coverage areas. Fading is not usually an issue with overlapping coverage areas of beacons and their large overall range.

Atmospheric attenuation plays a minor part in signal transmission range because it absorbs and scatters the signal. This type of loss is the least significant of those described.
Radiobeacon Reception

Various noise sources affect beacon reception and include:

- Engine noise
- Alternator noise
- Noise from power lines
- DC to AC inverting equipment
- Electric devices such as CRTs, electric motors, and solenoids

Noise generated by these types of equipment can mask the beacon signal, reducing or impairing reception.

Topic Last Updated: v1.00 / August 11, 2010
Radiobeacon Antenna Location

When using the internal beacon receiver as the correction source, antenna location will influence the performance of the internal beacon receiver.

A good location will:

- Have a clear view of the sky (important for GNSS, WAAS, and Atlas signal reception)
- Be at least three feet away from all forms of transmitting antennas, communications, and electrical equipment, to reduce the amount of noise present at the antenna
- Be the best for the application, such as the center line of the vehicle or vessel (the position calculated by the beacon receive is measured to the center of the antenna)
- Not be in areas that exceed specified environmental conditions
Atlas

Atlas Signal Information

The Atlas signal is a line-of-sight L-band signal that is similar to GNSS. For the Atlas differential receiver to acquire the signal, there must be a line of sight between the antenna and the geostationary communications satellite.

Various Atlas communications satellites are used for transmitting the correction data to Atlas users around the world. When the Atlas receiver has acquired an Atlas signal, the elevation and azimuth are available in the menu system to enable troubleshooting line-of-sight problems.

Contact your Atlas service provider for further information on this service.

Topic Last Updated: v1.11/November 15, 2018
Atlas Reception

Atlas services broadcast at a similar frequency to GNSS and as a result is a line-of-sight system; there must be a line of sight between the antenna and the Atlas satellite for reception of the service.

Atlas services use geostationary satellites for communication. The elevation angle to these satellites is dependent upon latitude. For latitudes higher than approximately 55° North or South, the Atlas signal may be blocked more easily by obstructions such as trees, buildings, and terrain.

Topic Last Updated: v1.07/ February 16, 2017
Atlas Automatic Tracking

The Hemisphere GNSS Atlas receiver features an automatic mode that allows it to locate the best spot beam if more than one is available in a particular region. With this function you do not need to adjust the receiver's frequency. The receiver also features a manual tune mode for flexibility.

See the \texttt{jFREQ} command for more information on automatic and manual tuning.

Topic Last Updated: v1.07 / February 16, 2017
Atlas Receiver Performance

Atlas receivers provide both a lock indicator and a BER (bit error rate) to describe the lock status and reception quality. Both these features depend on a line of sight between the antenna and the geostationary communications satellite broadcasting the Atlas correction information.

Atlas capable Hemisphere GNSS antennas are designed with sufficient gain at low elevation angles to perform well at higher latitudes where the signal power is lower and the satellite appears lower on the horizon. The BER number indicates the number of unsuccessfully decoded symbols in a moving window of 2048 symbols. Because of the use of forward error correction algorithms, one symbol is composed of two bits.

The BER has a default, no-lock value of 500. As the receiver begins to successfully acquire the signal a lower BER results. For best operation this value should be less than 150 and ideally less than 20.

Topic Last Updated: v1.07 / February 16, 2017
**Atlas Commands**

The following tables lists the commands accepted by the Atlas-band receiver to configure and monitor the Atlas functionality of the receiver.

<table>
<thead>
<tr>
<th>Command</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>$JI</td>
<td>Requests the serial number and firmware version number from the receiver</td>
</tr>
<tr>
<td>$JK</td>
<td>Is used to send an authorization code to the receiver</td>
</tr>
<tr>
<td>$JK,SHOW</td>
<td>Requests the subscription and activation information from the receiver,</td>
</tr>
<tr>
<td>$JASC,GPGGA,1</td>
<td>Requests receiver to output GGA positions at 1Hz.</td>
</tr>
<tr>
<td>$JASC,RD1,1</td>
<td>Enables Atlas Diagnostic message output</td>
</tr>
<tr>
<td>$JDIFF,LBAND,SAVE</td>
<td>Enables Atlas mode for tracking the Atlas communication satellites</td>
</tr>
<tr>
<td>$JDIFF,INCLUDE,ATLAS</td>
<td>Enables the Atlas solution in the receiver</td>
</tr>
<tr>
<td>$JFREQ,AUTO</td>
<td>Automatically sets the Atlas parameters to track the Atlas communication satellites</td>
</tr>
<tr>
<td>$JATLAS,LIMIT</td>
<td>Configure the accuracy threshold for when the NMEA 0183 GPGGA message reports a quality indicator of 4. See $JATLAS,LIMIT, section for more detail</td>
</tr>
<tr>
<td>$JSAVE</td>
<td>Saves issued commands</td>
</tr>
</tbody>
</table>

Note: Use the JSAVE command to save changes you need to keep and wait for the $J>SAVE COMPLETE response.

If your Atlas communication is working properly the following should apply:

- **Bit Error Rate**: less than 10-10
- **Spot Beam Freq**:
  - **AMERICAS**: 1545.915
  - **APAC**: 1545.855
  - **EMEA**: 1545.905
- **Nav Condition**: FFFFF

If this is not the case, then enter the following commands in the Receiver Command Page, one at a time:

<table>
<thead>
<tr>
<th>Command</th>
</tr>
</thead>
<tbody>
<tr>
<td>$JFREQ,AUTO</td>
</tr>
<tr>
<td>$JDIFF,LBAND,SAVE</td>
</tr>
</tbody>
</table>
Base IDs:
4715- Atlas with ITRF08 reference frame (default)
4716-Atlas with GDA94 reference frame*
4717-Atlas with User-specific local reference frame (Cartesian)*

*Available on select products
Base Station

DGPS Base Station Performance

Base station performance depends primarily on the site location for the base station GNSS antenna. An ideal location would have no obstructions above the height of the antenna, offering a full 180° by 360° view of the sky. In reality, obstructions such as trees, vehicles, people, and buildings nearby both block satellite signals and reflect interfering signals called multipath signals. Multipath degrades the accuracy of the satellite measurements and detracts from the receiver’s ability to provide accurate and reliable corrections for the rovers.

For a rover to work optimally, a base station should be near by the rover’s area of operation. As distance from the base to the rover increases, the modeling process cannot tune the solution to the exact environmental conditions at the rover’s location and the rover’s accuracy will not be as good. Best performance is attained when the distance from your base to your rover is less than 50 km (30 miles).

Topic Last Updated: v1.11/November 15, 2018
DGPS Base Station

The Hemisphere receiver with an e-Dif subscription can operate in a DGPS base station mode. JRAD commands need to be sent to the receiver to enter this mode. These commands may be automatically issued through customized software or through a simple terminal interface running on a PC or handheld device. DGPS Base Station Commands provide detailed information on the commands supported by the base station application.

Topic Last Updated: v1.11/November 15, 2018
DGPS Base Station Startup

When the receiver running the e-Dif application first starts up, it requires a few minutes to gather enough satellite tracking information to model the errors for the future. Once commands are sent to put the receiver into base station mode, corrections will be generated and can be sent via the serial port to rover receivers. In some more challenging GNSS environments, the time required to model errors can take up to 10 minutes. The receiver must be stationary during this process and the antenna for the base station must be secured in a stable location.
DGPS Base Station Calibration

Base station calibration is the process of modeling the errors at the base station. Calibration can be performed in either a relative or an absolute sense, depending on positioning needs. Relative positioning provides positions that are accurate to one another but there may be some offset from the true geographical position.

Calibrating for relative positioning is easier than for absolute position since you are not restricted to using a point with known coordinates. Calibrating for absolute positioning mode requires placing the GPS antenna at a known reference location. Care should be taken to use a location that has good sky visibility and is relatively free from obstructions.

Topic Last Updated: v1.11/November 15, 2018
e-Dif

e-Dif-Extended Differential Option

The Hemisphere receiver module is designed to work with Hemisphere GNSS' patented Extended Differential (e-Dif) software. e-Dif is an optional mode where the receiver can perform with differential-like accuracy for extended periods of time without the use of a differential service. It models the effects of ionosphere, troposphere, and timing errors for extended periods by computing its own set of pseudo-corrections.

e-Dif may be used anywhere geographically and is especially useful where SBAS networks have not yet been installed, such as South America, Africa, Australia, and Asia. Two things are required to enable e-Dif. First your receiver will require standard MFA application software to be installed on it. A software key, called a subscription code, is needed for the receiver to use e-Dif. Both can be installed in the field using a PC computer. See Using RightARM to Load Firmware if you need to install the application firmware onto your receiver. To install a subscription code, contact Hemisphere GNSS for a JK command which can be issued to your receiver.

Positioning with e-Dif is jump-free compared to a receiver working with just raw GPS provided the receiver consistently maintains a lock on at least four satellites at one time. The accuracy of positioning will have a slow drift that limits use of the e-Dif for approximately 30 to 40 minutes although it depends on how tolerant the application is to drift as e-Dif can be used for longer periods.

This mode of operation should be tested to determine if it is suitable for the application and for how long the user is comfortable with its use. As accuracy will slowly drift, the point at which to recalibrate e-Dif to maintain a certain level of accuracy must be determined.

The figure below displays the static positioning error of e-Dif while it is allowed to age for fourteen consecutive cycles of 30 minutes. The top line indicates the age of the differential corrections. The receiver computes a new set of corrections using e-Dif during the calibration at the beginning of each hour and modifies these corrections according to its models. After the initialization, the age correspondingly increases from zero until the next calibration.

The position excursion from the true position (the lines centered on the zero axis are northing [dark line] and easting [light line]) with increasing correction age is smooth from position to position; however, there is a slow drift to the position. The amount of drift depends on the rate of change of the environmental errors relative to the models used inside the e-Dif software engine.

Note: You decide how long e-Dif is to function before between calibrations and you should test this operation mode to determine an acceptable level of performance.
L-Dif

L-Dif Startup

On startup, the receiver with the L-Dif running requires several commands to initialize the proprietary messages that are sent over the air.

Topic Last Updated: v1.00 / August 11, 2010
L-D if Performance

The receiver’s positioning performance in L-Dif mode is dependant upon:

- Environment of the base and rover receivers
- Distance between them and
- Accuracy of the entered coordinates of the base station

Hemisphere GNSS suggests performing your own testing at your location to determine the level of performance you would expect on average. When testing this feature, conduct tests of 12-24 hours—in different environments—and monitor performance against a known coordinate. Do this over a number of days with different states of the ionosphere.

You can monitor the energy level of the ionosphere based upon the amount of solar flare activity at http://www.spaceweather.com.

Topic Last Updated: v1.06 / March 10, 2015
L-Dif Local Differential Option

Local differential (L-Dif) is a specialized message type that can be sent only between two Crescent-based receivers. One receiver is used as the base station and must remain stationary. It is extremely useful to know the coordinates of the base station position but averaging the position over several days will also suffice. The second receiver is used as a rover and the messages must be sent either through a cable or over a radio link.

Topic Last Updated: v1.00 / August 11, 2010
RTK Overview

Real Time Kinematic (RTK) positioning is the highest form of navigational accuracy for GNSS receivers. Hemisphere GNSS offers RTK for both Crescent and Eclipse platforms. See RTK commands for more information.

Topic Last Updated: v1.07 / February 16, 2017
Post-Processing

Hemisphere receiver modules can output raw measurement data for post processing applications. The raw measurement and ephemeris data are contained in the following messages, which must be logged in a binary file:

Observations: Bin 76 (GPS), Bin 66 (GLONASS), Bin 36 (BEIDOU) Or Bin 16 (All constellations; required for GALILEO)

Ephemeris: Bin 95 (GPS), Bin 65 (GLONASS), Bin 35 (BEIDOU), Bin 45 (GALILEO)

Time conversion: Bin 94 (GPS), Bin 34 (BEIDOU), Bin 44 (GALILEO)

(Crescent receivers must log Bin 94, 95, and 96 messages for GPS). Depending on the application, the binary data can be logged to a file and then translated to RINEX at a later time on a PC.

Contact Hemisphere GNSS technical support for a RINEX translator.

Because there is limited ability to store station information in the binary file, developers may consider writing their own translator.

Topic Last Updated: v1.11 / November 15, 2018
Receiver Operation

Evaluating Receiver Performance

Hemisphere GNSS evaluates performance of the receiver with the objective of determining best-case performance in a real-world environment. Our testing has shown that the receiver achieves a performance better than 0.6 m 95% of the time in typical DGPS modes.

The qualifier of 95% is a statistical probability. Manufacturers often use a probability of RMS, one sigma, or one standard deviation. These three terms all mean the same thing and represent approximately 67% probability. Performance measures with these probabilities are not directly comparable to a 95% measure since they are lower probability (less than 70% probability).

Table 1 summarizes the common horizontal statistical probabilities.

<table>
<thead>
<tr>
<th>Accuracy Measure</th>
<th>Probability (%)</th>
</tr>
</thead>
<tbody>
<tr>
<td>rms (root mean square)</td>
<td>63 to 68</td>
</tr>
<tr>
<td>CEP (circular error probability)</td>
<td>50</td>
</tr>
<tr>
<td>R95 (95% radius)</td>
<td>95 to 98</td>
</tr>
<tr>
<td>2drms (twice the distance root)</td>
<td>95</td>
</tr>
</tbody>
</table>

It is possible to convert from one statistic to another using Table 2. Using the value where the 'From' row meets the 'To' column, multiply the accuracy by this conversion value.

<table>
<thead>
<tr>
<th>From</th>
<th>CEP</th>
<th>rms</th>
<th>R95</th>
<th>2drms</th>
</tr>
</thead>
<tbody>
<tr>
<td>CEP</td>
<td>1</td>
<td>1.2</td>
<td>2.1</td>
<td>2.4</td>
</tr>
<tr>
<td>rms</td>
<td>0.83</td>
<td>1</td>
<td>1.7</td>
<td>2.0</td>
</tr>
<tr>
<td>R95</td>
<td>0.48</td>
<td>.59</td>
<td>1</td>
<td>1.2</td>
</tr>
<tr>
<td>2drms</td>
<td>0.42</td>
<td>.5</td>
<td>.83</td>
<td>1</td>
</tr>
</tbody>
</table>

For example, Product A, after testing, has an accuracy of 90 cm 95% of the time (R95). To compare this to Product B that has a sub-meter horizontal rms specification of 60 cm:

1. Select the value from where the 'R95' row and the 'rms' column intersect (to convert to rms). This conversion value is 0.59.

2. Multiply the 90 cm accuracy by this conversion factor and the result is 53 cm rms. Compared to Product B’s 60cm specification of sub-meter rms, Product A offers better performance.

To properly evaluate one receiver against another statistically, the receivers should be using identical correction input (from an external source) and share the same antenna using a power splitter (equipped with appropriate DC-blocking of the receivers and a bias-T to externally power the antenna). With this setup, the errors in the system are identical with the exception of receiver noise.

Although this is a comparison of the GNSS performance qualities of a receiver, it excludes other performance merits of a GNSS engine. The dynamic ability of a receiver should always be compared in a similar way with the test subjects sharing the same antenna. Unless a receiver is moving, its software filters are not stressed in a similar manner to the final product application. When testing dynamically, a much more accurate reference would need to be used, such as an RTK system, so that a "truth" position per epoch is available.
Further, there are other performance merits of a GNSS engine such as its ability to maintain a lock on GNSS and SBAS satellites. When evaluating this ability, the same GNSS antenna should be shared between the receivers test subjects. For the sake of comparing the tracking availability of one receiver to another, no accurate “truth” system is required unless performance testing is also to be analyzed. Again, an RTK system would be required; however, it is questionable how its performance will fare with environments where there are numerous obstructions such as foliage. Other methods of providing a truth reference may need to be provided through observation times on surveyed monuments or traversing well-known routes.

Should you look to compare two RTK systems, determining truth can be very complicated. A rigorous dynamic comparison of two competing RTK systems should only be attempted by individuals and organizations familiar with RTK and potentially with inertial navigation equipment. Fortunately, most manufacturer's RTK performance is specified in similar accuracy values, and in general, RTK accuracy is quite similar across different manufacturers.

Topic Last Updated: v1.07 / February 16, 2017
Receiver Operation

When turned on, the receiver goes through an internal startup sequence. It is, however, ready to communicate immediately. Refer to the receiver-specific manual for the power specifications of the product.

When its antenna has an unobstructed view of the sky, the receiver provides a position in approximately 60 seconds and acquires SBAS lock in approximately 30 seconds.

Topic Last Updated: v1.11/ November 15, 2018
Communicating with the Receiver

The receiver module features three primary serial ports (A, B, C) that may be configured independently of each other. The ports can be configured to output a combination of data types:

- NMEA 0183
- Hemisphere GNSS proprietary binary and ASCII formats
- RTCM v2.x, 3.x, proprietary ROX and CMR

The usual data output is NMEA 0183 messages because these are the industry standard.

Topic Last Updated: v1.11 / November 15, 2018
Configuring the Receiver

You can configure all aspects of receiver operation through any serial port using NMEA 0183 commands. You can select one of the two on-board applications.

- Two applications may be loaded at the same time, but only one can be active.
- You can select the active application through serial commands or through menu options on products with displays.
- Set the baud rate of communication ports.
- Select NMEA 0183 data messages to output on the serial ports and select the output rate of each message.
- Set the maximum differential age cut-off.
- Set the satellite elevation angle cut-off mask.

The appropriate commands are described in Commands and Messages.

Topic Last Updated: v1.07 / February 16, 2017
Saving the Receiver Configuration

Each time the configuration of the receiver is changed, the new configuration should be saved so the receiver does not have to be reconsidered for the next power cycle.

To save the settings issue the JSAVE command. The receiver records the current configuration to non-volatile memory. The receiver indicates when the save process, which takes about five seconds, is complete.

Topic Last Updated: v1.00 / August 11, 2010
Commands and Messages

Commands and Messages Overview

The receiver supports a selection of NMEA 0183 messages, proprietary messages that conform to NMEA 0183 standards, and Hemisphere GNSS proprietary binary messages. It is your decision as a systems designer whether or not to support a NMEA 0183-only software interface or a selection of both NMEA 0183 and binary messages.

All Crescent and Eclipse receivers are configured with NMEA 0183 commands and can output NMEA 0183 messages. In addition to NMEA 0183, some receivers can be configured using NMEA 2000 commands and can output NMEA 2000 messages.

Commands

Beacon receiver commands and messages
DGPS base station commands
e-Dif commands

General Operation and Configuration Commands

GLONASS commands and messages
GNSS commands

Local differential and RTK commands and messages

SBAS commands
RAIM commands

Vector commands and messages

Messages

Binary messages
Data messages

NMEA 0183 messages
NMEA 2000 CAN messages

Topic Last Updated: v1.07 / February 16, 2017
NMEA 0183 Messages

NMEA 0183 is a communications standard established by the National Marine Electronics Association (NMEA). NMEA 0183 provides data definitions for a variety of navigation instruments and related equipment such as gyrocompasses, Loran receivers, echo sounders, and GNSS receivers.

NMEA 0183 functionality is virtually standard on all GNSS equipment available. NMEA 0183 has an ASCII character format that enables the user to read the data via a receiving device with terminal software.

The following is an example of one second of NMEA 0183 data from the receiver:

$GPGGA,144049.0,5100.1325,N,11402.2729,W,1,07,1.0,1027.4,M,0,M,,010 *61

$GPVTG,308.88,T,308.88,M,0.04,N,0.08,K*42

$GPGSV,3,1,10,02,73,087,54,04,00,172,39,07,66,202,54,08,23,147,48,*7 9

$GPGSV,3,2,10,09,23,308,54,11,26,055,54,15,00,017,45,21,02,353,45*78

$GPGSV,3,3,10,26,29,257,51,27,10,147,45,45,,,,,,,,,*74

The NMEA 0183 standard allows manufacturers to define proprietary custom commands and to combine data into proprietary custom messages. Proprietary NMEA 0813 messages are likely to be supported only by specific manufacturers.

All messages and ports can be configured independently (see example below).

<table>
<thead>
<tr>
<th>Port</th>
<th>Baud Rate</th>
<th>Messages</th>
</tr>
</thead>
<tbody>
<tr>
<td>A</td>
<td>9600</td>
<td>GPGGA, one every 1 second</td>
</tr>
<tr>
<td></td>
<td></td>
<td>GPGSV, one every 5 seconds</td>
</tr>
<tr>
<td>B</td>
<td>19200</td>
<td>GPGGA, one every 2 seconds</td>
</tr>
<tr>
<td></td>
<td></td>
<td>Bin1, one every 1 second</td>
</tr>
<tr>
<td></td>
<td></td>
<td>Bin2, one every 1 second</td>
</tr>
</tbody>
</table>

A selection of NMEA 0183 data messages can be configured at various update rates with each message having a maximum update rate. A different selection of NMEA 0183 messages with different rates can be configured on another port.

Commands and Messages Overview presents information about the NMEA 0183 interface of the receiver smart antenna. See Reference Documents for contact information if you need to purchase a copy of the NMEA 0183 standard.

Topic Last Updated: v1.07 / February 16, 2017
NMEA 0183 Message Format

NMEA 0183 messages (sentences) have the following format:

$XXYYY,ZZZ,ZZZ,ZZZ...*CC<CR><LF>

where:

<table>
<thead>
<tr>
<th>Element</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>$</td>
<td>Message header character</td>
</tr>
<tr>
<td>XX</td>
<td>NMEA 0183 talker field (GP = GPS, GL = GLONASS, GA = GALILEO, GB = BEIDOU, GN = All constellations)</td>
</tr>
<tr>
<td>YYY</td>
<td>Type of GPS NMEA 0183 message</td>
</tr>
<tr>
<td>ZZZ</td>
<td>Variable length message fields</td>
</tr>
<tr>
<td>*CC</td>
<td>Checksum</td>
</tr>
<tr>
<td>&lt;CR&gt;</td>
<td>Carriage return</td>
</tr>
<tr>
<td>&lt;LF&gt;</td>
<td>Line feed</td>
</tr>
</tbody>
</table>

Null (empty) fields occur when there is no information for that field. You can use the JNP command to specify the number of decimal places output in the GPGGA and GPGLL messages.

What does <CR><LF> mean?

The literal translation means “Carriage Return, Line Feed.” These are terms used in computer programming languages to describe the end of a line or string of text. If you are writing your own communication software for a receiver, see some of the examples below. If you are already using a program such as Hemisphere GNSS’ PocketMax, when you click to send a command to the receiver, the program adds the carriage return and line feed to the end of the text string for you. If you are using HyperTerminal or other terminal software, typically the Enter key on your keyboard is set to send the <CR><LF> pair. You may need to define this in the setup section of the terminal software. Some software may treat the Enter key on your numeric keypad differently than the main Enter key in the main QWERTY section of the keyboard – use the main Enter key for best results.

Electronics use different ways to represent the <CR><LF> characters. In ASCII numbers, <CR> is represented as 13 in decimal, or 0D in hexadecimal. ASCII for <LF> is 10 decimal, or 0A hexadecimal. Some computer languages use different ways to represent <CR><LF>. Unix and C language can use “\r\n” in some instances. Java may use CR+LF. In Unicode, carriage return is U+000D, and line feed is U+000A. It is advised to clearly understand how to send these characters if you are writing your own interface software.

### General Operation and Configuration Commands

The following table lists the commands related to the general operation and configuration of the receiver.

<table>
<thead>
<tr>
<th>Command</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>JAIR</td>
<td>Specify how the receiver will respond to the dynamics associated with airborne applications</td>
</tr>
<tr>
<td>JALT</td>
<td>Turn altitude aiding for the receiver on or off</td>
</tr>
<tr>
<td>JAPP</td>
<td>Specify or query receiver application firmware</td>
</tr>
<tr>
<td>JASC,D1</td>
<td>Set the RD1 diagnostic information message from the receiver to on or off</td>
</tr>
<tr>
<td>JASC,VIRTUAL</td>
<td>Configure the receiver to have RTCM data input on one port and output through the other (when using an external correction source)</td>
</tr>
<tr>
<td>JBAUD</td>
<td>Specify the baud rates of the receiver or query the current setting</td>
</tr>
<tr>
<td>JBOOT</td>
<td></td>
</tr>
<tr>
<td>JBIN</td>
<td>Enable the output of the various binary messages supported by the receiver</td>
</tr>
<tr>
<td>JCONN</td>
<td>Create a virtual circuit between the A and B ports to enable communication through the receiver to the device on the opposite port</td>
</tr>
<tr>
<td>JDIFF</td>
<td>Specify or query the differential mode of the receiver</td>
</tr>
<tr>
<td>JDIFF,AVAILABLE</td>
<td>Query the receiver for the differential types currently being received</td>
</tr>
<tr>
<td>JDIFFX,EXCLUDE</td>
<td>Specify the differential sources to be excluded from operating in a multi-diff application</td>
</tr>
<tr>
<td>JDIFFX,GNSSOUT</td>
<td>Specify GNSS output in correction formats or query the current setting</td>
</tr>
<tr>
<td>JDIFFX,INCLUDE</td>
<td>Specify the differential sources to be allowed to operate in a multi-diff application</td>
</tr>
<tr>
<td>JDIFFX,SOURCE</td>
<td>Query the receiver for the differential source</td>
</tr>
<tr>
<td>JDIFFX,TYPE</td>
<td>Query the receiver for the differential type</td>
</tr>
<tr>
<td>JEPHOUT,PERIODSEC</td>
<td>to allow ephemeris messages (95, 65, 35) to go out a rate other than when they change</td>
</tr>
<tr>
<td>JFLASH DIR</td>
<td>Display the files on a USB flash drive</td>
</tr>
<tr>
<td>JFLASH FILE CLOSE</td>
<td>Close an open file on a USB flash drive</td>
</tr>
<tr>
<td>JFLASH FILE NAME</td>
<td>Open a specific file, append to a specific file, or display the file name of the open file on a USB flash drive</td>
</tr>
<tr>
<td>JFLASH FILE OPEN</td>
<td>Create and open a file with an automatically generated file name on a USB flash drive</td>
</tr>
<tr>
<td>JFLASH FREESPACE</td>
<td>Display the free space in kilobytes (KB) on a USB flash drive</td>
</tr>
<tr>
<td>JFLASH, NOTIFY, CONNECT</td>
<td>Enable/disable the automatic response when a USB flash drive is inserted or removed (if port is not specified the response will be sent to the port that issued the command)</td>
</tr>
<tr>
<td>Command</td>
<td>Description</td>
</tr>
<tr>
<td>-----------------------</td>
<td>-----------------------------------------------------------------------------</td>
</tr>
<tr>
<td>JFLASH,QUERYCONNECT</td>
<td>Manually verify if a USB flash drive is connected or disconnected</td>
</tr>
<tr>
<td>JFORCEAPP</td>
<td>Force an application to be used in a multi-application (MFA)</td>
</tr>
<tr>
<td>JHTYPE, SHOW</td>
<td>Queries the hardware type</td>
</tr>
<tr>
<td>JI</td>
<td>Display receiver information, such as its serial number and firmware version</td>
</tr>
<tr>
<td>JK</td>
<td>Subscribe the receiver to various options, such as higher update rates, e-Dif or L-Dif, or query for the current subscription expiration date when running Atlas application or the receiver subscription code when running all other applications</td>
</tr>
<tr>
<td>JK,SHOW</td>
<td>contain authorization information</td>
</tr>
<tr>
<td>JLIMIT</td>
<td>Set the threshold of estimated horizontal performance for which the DGPS position LED is illuminated or query the current setting</td>
</tr>
<tr>
<td>JMODE</td>
<td>Query receiver for status of JMODE settings</td>
</tr>
<tr>
<td>JMODE,BASE</td>
<td>Enable/disable base mode functionality or query the current setting</td>
</tr>
<tr>
<td>JMODE,FIXLOC</td>
<td>Set the receiver to not re-average (or re-average) its position or query the current setting</td>
</tr>
<tr>
<td>JMODE,FOREST</td>
<td>Turn the higher gain functionality (for tracking under canopy) on/off or query the current setting</td>
</tr>
<tr>
<td>JMODE,GLOFIX</td>
<td>Enable/disable use of RTCM v3 (RTK) GLONASS correctors</td>
</tr>
<tr>
<td>JMODE,MIXED</td>
<td>Include satellites that do not have differential corrections in the solution</td>
</tr>
<tr>
<td>JMODE,NULLNMEA</td>
<td>Enable/disable output of NULL fields in NMEA 0183 messages when no there is no fix (when position is lost)</td>
</tr>
<tr>
<td>JMODE,SBASNORTK</td>
<td>Disable/enable the use of SBAS ranging signals (carrier phase) in RTK</td>
</tr>
<tr>
<td>JMODE,SBASR</td>
<td>Enable/disable SBAS ranging</td>
</tr>
<tr>
<td>JMODE,STRICTRTK</td>
<td>Use this command to invoke stricter checks on whether RTK fix is declared. Forces float of RTK at 30 seconds of Age-of-Diff</td>
</tr>
<tr>
<td>JMODE,SURETRACK</td>
<td>Enable/disable SureTrack functionality (default is enabled) or query the current setting</td>
</tr>
<tr>
<td>JMODE,SURVEY</td>
<td>Assure RTK fix is not declared when residual errors exceed 10 cm. Also forces use of GLONASS and prevents SureTrack operation.</td>
</tr>
<tr>
<td>JMODE,TIMEKEEP</td>
<td>Enable/disable continuous time updating in NMEA 0183 messages when there is no fix (when position is lost)</td>
</tr>
<tr>
<td>JMODE,TUNNEL</td>
<td>Enable/disable faster reacquisition after coming out of a tunnel or query the current setting</td>
</tr>
<tr>
<td>JPOS</td>
<td>Speed up the initial acquisition when changing continents with the receiver or query the receiver for the current position of the receiver</td>
</tr>
<tr>
<td>Command</td>
<td>Description</td>
</tr>
<tr>
<td>-----------</td>
<td>-------------</td>
</tr>
<tr>
<td>JPPS,FREQ</td>
<td>Specify the pps frequency of the receiver or query the current setting</td>
</tr>
<tr>
<td>JPPS,WIDTH</td>
<td>Specify the pps width of the receiver or query the current setting</td>
</tr>
<tr>
<td>JPRN,EXCLUDE</td>
<td>For advanced users only. Exclude GPS and/or other GNSS satellites from being used in the positioning solution or query the current setting</td>
</tr>
<tr>
<td>JQUERY,GUIDE</td>
<td>Query the receiver for its determination on whether or not it is providing suitable accuracy after both the SBAS and GPS have been acquired (up to five minutes)</td>
</tr>
<tr>
<td>JQUERY,TEMPERATURE</td>
<td>Query the receiver’s temperature</td>
</tr>
<tr>
<td>JRELAY</td>
<td>Send user-defined text out of a serial port</td>
</tr>
<tr>
<td>JRESET</td>
<td>Reset the receiver to its default operating parameters by turning off outputs on all ports, saving the configuration, and setting the configuration to its defaults</td>
</tr>
<tr>
<td>JSAVE</td>
<td>Send this command after making changes to the operating mode of the receiver</td>
</tr>
<tr>
<td>JSHOW</td>
<td>Query the current operating configuration of the receiver</td>
</tr>
<tr>
<td>JSHOW,ASC</td>
<td>Query receiver for current ASCII messages being output</td>
</tr>
<tr>
<td>JSHOW,BIN</td>
<td>Query receiver for current Bin messages being output</td>
</tr>
<tr>
<td>JSHOW,CONF</td>
<td>Query receiver for configuration settings</td>
</tr>
<tr>
<td>JSHOW,GP</td>
<td>Query the receiver for each GP message currently being output through the current port and the update rate for that message</td>
</tr>
<tr>
<td>JSHOW,THISPORT</td>
<td>Query to determine which receiver port you are connected to</td>
</tr>
<tr>
<td>JSIGNALSELCLUDE</td>
<td>Query the receiver for the signals for which you are disabling tracking</td>
</tr>
<tr>
<td>JSIGNALSELCLUDE</td>
<td>Query the receiver for the signals for which you are enabling tracking</td>
</tr>
<tr>
<td>JSYSVER</td>
<td>Returns the boot loader version from the GPS card</td>
</tr>
</tbody>
</table>

Note: Use the JSAVE command to save changes you need to keep and wait for the "$>SAVE COMPLETE" response.
GNSS Commands

The following table lists the commands supported by the internal GNSS engine for its configuration and operation.

<table>
<thead>
<tr>
<th>Command</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>JAGE</td>
<td>Specify maximum DGPS (COAST) correction age (6 to 8100 seconds)</td>
</tr>
<tr>
<td>JASC,GN</td>
<td>Enable the GPS data messages at a particular update rate to be turned on or off</td>
</tr>
<tr>
<td>JMASK</td>
<td>Specify the elevation cutoff mask angle for the GPS engine</td>
</tr>
<tr>
<td>JNMEA,PRECISION</td>
<td>Specify or query the number of decimal places to output in the GPGGA and the GPGLL messages or query the current setting</td>
</tr>
<tr>
<td>JNP</td>
<td>Specify the number of decimal places output in the GPGGA and GPGLL messages</td>
</tr>
<tr>
<td>JOFF</td>
<td>Turn off all data messages being output through the current port or other port</td>
</tr>
<tr>
<td>JOFF,ALL</td>
<td>Turn off all data messages being output through all ports</td>
</tr>
<tr>
<td>JSMOOTH</td>
<td>Set the carrier smoothing interval (15 to 6000 seconds) or query the current setting</td>
</tr>
<tr>
<td>JTAU,COG</td>
<td>Set the course over ground (COG) time constant (0.00 to 3600.00 seconds) or query the current setting</td>
</tr>
<tr>
<td>JTAU,SPEED</td>
<td>Set the speed time constant (0.00 to 3600.00 seconds) or query the current setting</td>
</tr>
</tbody>
</table>

Note: Use the JSAVE command to save changes you need to keep and wait for the $>SAVE COMPLETE response.

The following table lists the messages applicable to GNSS:

<table>
<thead>
<tr>
<th>Message</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Bin16</td>
<td>GNSS code and phase observation information</td>
</tr>
<tr>
<td>Bin19</td>
<td>GNSS Tracking Information</td>
</tr>
</tbody>
</table>

Topic Last Updated: v1.07/ February 16, 2017
SBAS Commands

The following table lists the commands supported by the SBAS demodulator for its control and operation.

<table>
<thead>
<tr>
<th>Command</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>JASC D1</td>
<td>Set the RD1 diagnostic information message from the receiver to on or off</td>
</tr>
<tr>
<td>JASC RTCM</td>
<td>Configure the receiver to output RTCM version 2 DGPS corrections from SBAS or beacon through either receiver serial port</td>
</tr>
<tr>
<td>JGEO</td>
<td>Display information related to the current frequency of SBAS and its location in relation to the receiver's antenna</td>
</tr>
<tr>
<td>JWAASPRN</td>
<td>Change the SBAS PRNs in memory or query the receiver for current PRNs in memory</td>
</tr>
</tbody>
</table>

Note: Use the JSAVE command to save changes you need to keep and wait for the $>SAVE COMPLETE response.

Topic Last Updated: v1.00 / August 11, 2010
### e-Dif Commands

The following table lists the commands supported by the e-Dif application for its control and operation.

<table>
<thead>
<tr>
<th>Command</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>JRAD,1</td>
<td>Display the current reference position in e-Dif applications only</td>
</tr>
<tr>
<td>JRAD,1 LAT, LON, HEIGHT</td>
<td>Use this command—a derivative of the JRAD,1 P command—when absolute positioning is required in e-Dif applications only</td>
</tr>
<tr>
<td>JRAD,1 P</td>
<td>e-Dif: Record the current position as the reference with which to compute e-Dif corrections. This would be used in relative mode as no absolute point information is specified. DGPS Base Station: Record the current position as the reference with which to compute Base Station corrections in e-Dif applications only. This would be used in relative mode as no absolute point information is specified</td>
</tr>
<tr>
<td>JRAD,2</td>
<td>Forces the receiver to use the new reference point (you normally use this command following a JRAD,1 type command)</td>
</tr>
<tr>
<td>JRAD,3</td>
<td>Invoke the e-Dif function once the unit has started up with the e-Dif application active, or, update the e-Dif solution (calibration) using the current position as opposed to the reference position used by the JRAD,2 command</td>
</tr>
<tr>
<td>JRAD,7</td>
<td>Turn auto recalibration on or off</td>
</tr>
</tbody>
</table>

Note: Use the JSAVE command to save changes you need to keep and wait for the $>SAVE COMPLETE response.

Topic Last Updated: v1.02 / January 25, 2011
## Vector Commands and Messages

The following table lists the commands related to the GPS heading aspect of the Vector OEM heading system.

<table>
<thead>
<tr>
<th>Command</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>JASC</td>
<td>Turn on different messages</td>
</tr>
<tr>
<td>JASC,INTLT</td>
<td>Configure the receiver to output pitch and roll data (pitch and roll are factory calibrated over temperature to be accurate to ±3°)</td>
</tr>
<tr>
<td>JASC,PAshR</td>
<td>Configure the receiver to output time, true heading, roll, and pitch data in one message</td>
</tr>
<tr>
<td>JASC,PTSS1</td>
<td>Configure the receiver to output heave, pitch, and roll in the commonly used TSS1 message format</td>
</tr>
<tr>
<td>$JATT,ACC90</td>
<td>Refer to the User Guide for your product</td>
</tr>
<tr>
<td>$JATT, ACC180</td>
<td>Refer to the User Guide for your product</td>
</tr>
<tr>
<td>JATT,COGTAU</td>
<td>Set the course over ground (COG) time constant (0.0 to 3600.0 seconds) or query the current setting</td>
</tr>
<tr>
<td>JATT,CSEP</td>
<td>Query for the current separation between GPS antennas</td>
</tr>
<tr>
<td>JATT,EXACT</td>
<td>Enable/disable internal filter reliance on the entered antenna separation or query the current setting</td>
</tr>
<tr>
<td>JATT,FLIPBRD</td>
<td>Turn the flip feature on/off (allowing you to install the Crescent Vector board upside down) or query the current feature status</td>
</tr>
<tr>
<td>JATT,GYROAID</td>
<td>Turn gyro aiding on or off or query the current setting</td>
</tr>
<tr>
<td>JATT,HBias</td>
<td>Set the heading bias or query the current setting</td>
</tr>
<tr>
<td>JATT,HELP</td>
<td>Show the available commands for GPS heading operation and status</td>
</tr>
<tr>
<td>JATT,HIGHMP</td>
<td>Set/query the high multipath setting for use in poor GPS environments</td>
</tr>
<tr>
<td>JATT,HRTAU</td>
<td>Set the heading rate time constant or query the current setting</td>
</tr>
<tr>
<td>JATT,HTAU</td>
<td>Set the heading time constant or query the current setting</td>
</tr>
<tr>
<td>JATT,LEVEL</td>
<td>Turn level operation on or off or query the current setting</td>
</tr>
<tr>
<td>JATT,MOVEBASE</td>
<td>Set the auto GPS antenna separation or query the current setting</td>
</tr>
<tr>
<td>JATT,MSEP</td>
<td>Manually set the GPS antenna separation or query the current setting</td>
</tr>
<tr>
<td>JATT,NEGTILT</td>
<td>Turn the negative tilt feature on or off or query the current setting</td>
</tr>
<tr>
<td>JATT,NMEAHE</td>
<td>Instruct the Crescent Vector to preface the HDG, HDM, HDT, and ROT messages with GP or HE</td>
</tr>
<tr>
<td>JATT,PBIAS</td>
<td>Set the pitch/roll bias or query the current setting</td>
</tr>
<tr>
<td>JATT,PTAU</td>
<td>Set the pitch time constant or query the current setting</td>
</tr>
<tr>
<td>JATT,ROLL</td>
<td>Configure the Crescent Vector for roll or pitch GPS antenna orientation</td>
</tr>
<tr>
<td>JATT,SEARCH</td>
<td>Force the Crescent Vector to reject the current GPS heading solution and begin a new search</td>
</tr>
<tr>
<td>JATT,SPDTAU</td>
<td>Set the speed time constant (0.0 to 3600.0 seconds) or query the current setting</td>
</tr>
<tr>
<td>JATT,SUMMARY</td>
<td>Display a summary of the current Crescent Vector settings</td>
</tr>
<tr>
<td>JATT,TILTaid</td>
<td>Turn tilt aiding on or off or query the current setting</td>
</tr>
<tr>
<td>JATT,TILTCAL</td>
<td>Calibrate tilt aiding or query the current feature status</td>
</tr>
</tbody>
</table>
The following table lists Vector messages.

<table>
<thead>
<tr>

## DGPS Base Station Commands

The following table lists the commands supported by the base station feature for its control and operation.

<table>
<thead>
<tr>
<th>Command</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>JRAD,1</td>
<td>Display the current reference position in e-Dif applications only</td>
</tr>
<tr>
<td>JRAD,1 LAT, LON, HEIGHT</td>
<td>Use this command—a derivative of the JRAD,1, P command—when absolute positioning is required in e-Dif applications only</td>
</tr>
</tbody>
</table>
| JRAD,1, P      | **e-Dif:** Record the current position as the reference with which to compute e-Dif corrections. This would be used in relative mode as no absolute point information is specified.  
**DGPS Base Station:** Record the current position as the reference with which to compute Base Station corrections in e-Dif applications only. This would be used in relative mode as no absolute point information is specified. |
| JRAD,9         | Initialize the Base Station feature and use the previously entered point, either with $JRAD,1, P or $JRAD,1, LAT, LON, HEIGHT, as the reference with which to compute Base Station corrections in e-Dif applications only. Use this for both relative mode and absolute mode. |
| JRAD,10        | If $JRAD,10,1 is entered, the diff output will be RTCM2.4 |

Local Differential and RTK Commands and Messages

The following table lists the commands supported by Local Differential (L-Dif) and RTK feature for its control and operation.

<table>
<thead>
<tr>
<th>Command</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>JASC,CMR</td>
<td>Set the proprietary CMR messages to on or off to provide corrections to the rover (only applies to an Eclipse base station receiver when using GPS dual frequency RTK mode)</td>
</tr>
<tr>
<td>JASC,DFX</td>
<td>Set the proprietary DFX messages to on or off to provide corrections to the rover (only applies to a Crescent base receiver when using L-Dif or RTK mode)</td>
</tr>
<tr>
<td>JASC,ROX</td>
<td>Set the proprietary ROX messages to on or off to provide corrections to the rover (only applies to an Eclipse base station receiver when using GPS dual frequency RTK mode)</td>
</tr>
<tr>
<td>JASC,RTCM3</td>
<td>Set the RTCM version 3 messages to on or off to provide corrections to the rover (only applies to an Eclipse base station receiver when using GPS dual frequency RTK mode)</td>
</tr>
<tr>
<td>JASC,PSAT,BLV,1</td>
<td>Configure the receiver to output the North, East, Up base-line vector</td>
</tr>
<tr>
<td>JASC,PSAT,FVI,1</td>
<td>Configure the receiver to output a message include most position and attitude information</td>
</tr>
<tr>
<td>JASC,PSAT,RTKPROG</td>
<td>Configure the receiver to output RTK fix progress</td>
</tr>
<tr>
<td>JASC,PSAT,RTKSTAT</td>
<td>Configure the receiver to output the most relevant parameters affecting RTK</td>
</tr>
<tr>
<td>JASC,PSAT,VCT,1</td>
<td>Configure the receiver to output the heading, pitch, roll, and master to slave vector</td>
</tr>
<tr>
<td>JMODE,BASE</td>
<td>Enable/disable base mode functionality or query the current setting</td>
</tr>
<tr>
<td>JNMEA,PRECISION</td>
<td>Specify or query the number of decimal places to output in the GPGGA and the GPGLL messages or query the current setting</td>
</tr>
<tr>
<td>JNP</td>
<td>Specify the number of decimal places output in the GPGGA and GPGLL messages</td>
</tr>
<tr>
<td>JQUERY,RTKPROG</td>
<td>Perform a one-time query of RTK fix progress information</td>
</tr>
<tr>
<td>JQUERY,RTKSTAT</td>
<td>Perform a one-time query of the most relevant parameters that affect RTK</td>
</tr>
<tr>
<td>JRTK,1</td>
<td>Show the receiver’s reference position (can issue command to base station or rover)</td>
</tr>
<tr>
<td>JRTK,1,LAT,LON,HEIGHT</td>
<td>Set the receiver’s reference position to the coordinates you enter (can issue command to base station or rover)</td>
</tr>
<tr>
<td>JRTK,1,P</td>
<td>Set the receiver’s reference coordinates to the current calculated position if you do not have known coordinates for your antenna location (can issue command to base station or rover)</td>
</tr>
<tr>
<td>JRTK,5</td>
<td>Show the base station’s transmission status for RTK applications (can issue command to base station)</td>
</tr>
<tr>
<td>JRTK,5,Transmit</td>
<td>Suspend or resume the transmission of RTK (can issue command to base station)</td>
</tr>
<tr>
<td>JRTK,6</td>
<td>Display the progress of the base station (can issue command to base station)</td>
</tr>
<tr>
<td>JRTK,12</td>
<td>Disable or enable the receiver to go into fixed integer mode (RTK) vs. float mode (L-Dif) - can issue command to rover</td>
</tr>
<tr>
<td>JRTK,17</td>
<td>Display the transmitted latitude, longitude, and height of the base station (can issue command to base station or rover)</td>
</tr>
<tr>
<td>JRTK,18</td>
<td>Display the distance from the rover to the base station, in meters (can issue command to rover)</td>
</tr>
<tr>
<td>JRTK,18,BEARING</td>
<td>Display the bearing from the base station to the rover, in degrees (can issue command to rover)</td>
</tr>
<tr>
<td>JRTK,18,NEU</td>
<td>Display the distance from the rover to the base station and the delta North, East, and Up, in meters (can issue command to rover)</td>
</tr>
</tbody>
</table>
JRTK,28

Set the base station ID transmitted in ROX/DFX/CMR/RTCM3 messages (can issue command to base station)

JRTCM3, ANTNAME

Specify the antenna name that is transmitted in various RTCM3 messages from the base

JRTCM3, EXCLUDE

Specify RTCM3 message types to not be transmitted (excluded) by base station

JRTCM3, INCLUDE

Specify RTCM3 message types to be transmitted by base station

JRTCM3, NULLANT

Specify the antenna name as null (no name) that is transmitted in various RTCM3 messages from the base

The following table lists the Local Differential (L-Diff) and RTK messages.

<table>
<thead>
<tr>
<th>Message</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>PSAT,RTKPROG</td>
<td>Contains RTK fix progress information</td>
</tr>
<tr>
<td>PSAT,RTKSTAT</td>
<td>Contains the most relevant parameters affecting RTK</td>

</tbody>
</table>

Topic Last Updated: v1.07 / October 13, 2016
Beacon Receiver Commands and Messages

If integrating a Hemisphere GNSS SBX beacon module with the receiver GNSS engine, Hemisphere GNSS recommends interfacing the beacon receiver to Port D of the receiver engine. Hemisphere GNSS has implemented some command and message pass-through intelligence for such an integration. In this configuration you can issue the commands in the following table to the beacon receiver through either Port A, Port B, or Port C of the receiver. When you issue queries to the SBX primary communications port, the response messages are output interspersed with RTCM correction information. This may cause conflicts with a GNSS receiver’s ability to compute differential corrected solutions. By sending these queries to the SBX secondary communications port the flow of RTCM corrections on the primary port will not be interrupted.

The following table lists the beacon commands/messages found in this Help file.

<table>
<thead>
<tr>
<th>Query</th>
<th>NMEA 0183 Query Type</th>

RAIM Commands

RAIM (Receiver Autonomous Integrity Monitoring) is a GNSS integrity monitoring scheme that uses redundant ranging signals to detect a satellite malfunction resulting in a large range error. The Hemisphere GNSS products use RAIM to alert users when errors have exceeded a user-specified tolerance. RAIM is available for SBAS, and Beacon applications.

The following table lists the available RAIM commands.

<table>
<thead>
<tr>
<th>Command</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>JRAIM</td>
<td>Specify the parameters of the RAIM scheme that affect the output of the PSAT.GBS message or query the current setting</td>

Topic Last Updated: v1.11/ November 15, 2018
Binary Messages

Message Structure

The binary messages supported by the receiver are in an Intel Little Endian format for direct read in a PC environment. More information on this format at the following web site: http://www.cs.umass.edu/~verts/cs32/endian.html

Each binary message begins with an 8-byte header and ends with a carriage return, line feed pair (0x0D, 0x0A). The first four characters of the header is the ASCII sequence $BIN.

The following table provides the general binary message structure.

<table>
<thead>
<tr>
<th>Component</th>
<th>Description</th>
<th>Type</th>
<th>Bytes</th>
</tr>
</thead>
<tbody>
<tr>
<td>Header</td>
<td>Synchronization String</td>
<td>4 byte string</td>
<td>4</td>

<td>Magnetic Variation</td>
<td>1 Hz*</td>
</tr>
<tr>
<td>127257</td>
<td>Attitude, Yaw, Pitch, Roll</td>
<td>1 Hz*</td>
</tr>
</tbody>
</table>

* These messages may be off when heading is not supported.

For a list of Hemisphere GNSS Proprietary Commands, refer to the NMEA 2000 Reference Manual on the HGNSS website.
Note: Not all products support the messages listed above.

Related Commands:

GPCRQ,MSS

Topic Last Updated: v.1.00 / August 11, 2020
GPCRQ,MSS Command

Command Type:
Beacon Receiver

Description:
Standard query to prompt the SBX for its performance status (response is the CRMSS message)
You can issue this command through the secondary serial port with a standard response issued to the same port. This will not affect the output of RTCM data from the main serial port when the receiver has acquired a lock on a beacon station.

Command Format:
$GPCRQ,MSS<CR><LF>

Receiver Response:
$CRMSS,xx,yy,fff.f,ddd*CC<CR><LF>

where:

<table>
<thead>
<tr>
<th>Response Component</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>xx</td>
<td>Signal strength in dBμV/m</td>
</tr>
<tr>
<td>yy</td>
<td>Signal-to-noise ratio (SNR) in dB</td>
</tr>
<tr>
<td>fff.f</td>
<td>Frequency in kHz (283.5 to 325)</td>
</tr>
<tr>
<td>ddd</td>
<td>MSK bit rate in bps (100 or 200)</td>
</tr>
</tbody>
</table>

Response example:
$CRMSS,65,36,322.0,100*CC

The signal strength is 65 dBμV/m, SNR is 36 dB, frequency is 322.0 kHz, and MSK bit rate is 100 bps.

Additional Information:
Topic Last Updated: v2.0/ April 30, 2019
GPMSK Command

Command Type:
Beacon Receiver

Description:
Beacon Tune command

Instruct the SBX to tune to a specified frequency and automatically select the correct MSK rate. When you send this command through Port A, Port B, or Port C, it is automatically routed to Port D. The resulting confirmation of this message is returned to the same port from which you sent the command.

Command Format:

$GPMSK,fff.f,F,mmm,M[n]<CR><LF>

where:

<table>
<thead>
<tr>
<th>Command/Response Component</th>
<th>Description</th>

<tr>
<td>n</td>
<td>Period of output of CRMSS performance status message (0 to 100 seconds), where leaving the field blank will output the message once</td>
</tr>
</tbody>
</table>

Note: This field is optional when using database tuning mode or automatic tuning mode.

Receiver Response:

$CRMSS,xx,yy,fff.f,ddd*CC<CR><LF>

where:

<table>
<thead>
<tr>
<th>Response Component</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>xx</td>
<td>Signal strength in dBμV/m</td>
</tr>
</tbody>
</table>
### Signal-to-noise ratio (SNR) in dB

<table>
<thead>
<tr>
<th>yy</th>
<th>Signal-to-noise ratio (SNR) in dB</th>
</tr>
</thead>
<tbody>
<tr>
<td>fff.f</td>
<td>Frequency in kHz (283.5 to 325)</td>
</tr>
<tr>
<td>ddd</td>
<td>MSK bit rate in bps (100 or 200)</td>
</tr>
</tbody>
</table>

**Example:**

To instruct the SBX to tune to 310.5 kHz with a bit rate of 100 and output the CRMSS message every 20 seconds issue the following command:

\[
$GPMSK,310.5,M,100,M,20<CR><LF>$
\]

...and the receiver response is:

\[
$CRMSS,65,36,310.5,100*CC$
\]

(repeating every \(n=20\) seconds)

If using database tuning mode issue the following command:

\[
$GPMSK,,D,,D<CR><LF>$
\]

If using automatic tuning mode issue the following command:

\[
$GPMSK,,A,,A<CR><LF>$
\]

**Additional Information:**

When the SBX acknowledges this message, it immediately tunes to the specified frequency and demodulates at the specified rate.

When you set \(n\) to a non-zero value, the SBX outputs the CRMSS message at that period through the serial port from which the SBX was tuned. When you issue this command with a non-zero \(n\) value through Port B, the periodic output of the CRMSS performance status message does not impact the output of RTCM on Port A. However, when tuning the SBX with a non-zero \(n\) value through Port A, the CRMSS message is interspersed with the RTCM data. Most GPS engines will not be able to filter the CRMSS message, causing the overall data to fail parity checking. When power to the SBX is removed and reapplied, the status output interval resets to zero (no output).

When tuning the SBX engine, if the \(n\) field in this message is non-zero, the CRMSS message output by the SBX may interrupt the flow of RTCM data to the GPS receiver. Repower the SBX to stop the output of the CRMSS message or retune the Beacon receiver with \(n\) set to zero.

**Topic Last Updated:** v1.02 / January 25, 2011
GPS Commands

JAGE Command

Command Type:
GPS

Description:
Specify maximum DGPS (COAST) correction age (6 to 8100 seconds). Using COAST technology, the receiver can use old correction data for extended periods of time. If using aRTK, the parameter must be set to higher than 601 seconds.

The default setting for the receiver is 2700 seconds.

If you select a maximum correction age older than 1800 seconds (30 minutes) test the receiver to ensure the new setting meets the requirements, as accuracy will slowly drift with increasing time.

Command Format:
$JAGE,age<CR><LF>

where 'age' is the maximum differential age time out

Receiver Response:
$>

Example:
To set the DGPS correction age to 60 seconds issue the following command:

$JAGE,60<CR><LF>

Additional Information:
To query the receiver for the current DGPS correction age, issue the JSHOW command.

What does <CR><LF> mean?

Topic Last Updated: v2.0/ April 30, 2019
General Operation and Configuration

JAIR Command

Command Type:
General Operation and Configuration

Description:
Specify how the receiver will respond to the dynamics associated with airborne applications or query the current setting

Command Format:
Specify how the receiver responds:

$JAIR,r<CR><LF>

where 'r' is the AIR mode:

NORM - normal track and nav filter bandwidth

HIGH - highest track and nav filter bandwidth (receiver is optimized for the high dynamic environment associated with airborne platforms)

LOW - lowest track and nav filter bandwidth

AUTO - default track and nav filter bandwidth, similar to NORM but automatically goes to HIGH above 30m/sec

Query the current setting:

$JAIR<CR><LF>

Receiver Response:
Receiver response when specifying how the receiver responds or querying the current setting:

$>JAIR,MAN,NORM

$>JAIR,MAN,HIGH

$>JAIR,MAN,LOW

$>JAIR,AUTO,NORM

Example:
To set the AIR mode to LOW issue the following command:

$JAIR,LOW<CR><LF>

The response is then:

$>JAIR,MAN,LOW<CR><LF>

Additional Information:
Defaults to normal (NORM) which is recommended for most applications. The AUTO option enables the receiver to decide when to turn JAIR to HIGH.

CAUTION: Setting AIR mode to HIGH is not recommended for Crescent Vector operation.
On the HIGH setting, the receiver tolerates larger and sudden drops in the SNR value before it discards the data as being invalid. This additional tolerance is beneficial in applications such as crop dusting where an aircraft is banking rapidly. As the aircraft banks, the antenna position shifts from upright and having a clear view of the sky to being tipped slightly, with a possibly obscured view of the sky, and then back to upright. This sudden tipping of the antenna causes the SNR value to drop.

If the tolerance is not set as HIGH, the receiver views the data recorded while banking as invalid and discards it. As a result the GPS position will not be accurate.

The status of this command is also output in the JSHOW message.

Topic Last Updated: v1.02 / January 25, 2011
## JALT Command

**Command Type:**  
General Operation and Configuration

**Description:**  
Turn altitude aiding for the receiver on or off

When set to something other than NEVER, altitude aiding uses a fixed altitude instead of using one satellite’s observations to calculate the altitude. The advantage of this feature, when operating in an application where a fixed altitude is acceptable, is that the extra satellite’s observations can be used to the betterment of the latitude, longitude, and time offset calculations, resulting in improved accuracy and integrity. Marine markets, for example, may be well suited for use of this feature.

**Command Format:**

\$JALT,c[,h[,GEOID]]<CR><LF>

where 'c' (feature status variable) and 'h' (threshold variable) may be one of the following:

<table>
<thead>
<tr>
<th>c Value</th>
<th>Corresponding h Value</th>
<th>Description</th>
<th>Format</th>
</tr>
</thead>
<tbody>
<tr>
<td>NEVER</td>
<td>N/A</td>
<td>Default mode of operation where altitude aiding is not used.</td>
<td>$JALT,NEVER&lt;CR&gt;&lt;LF&gt;</td>
</tr>
<tr>
<td>SOMETIMES</td>
<td>PDOP</td>
<td>Sets the receiver to use altitude aiding depending upon the PDOP threshold.</td>
<td>$JALT,SOMETIMES,PDOP&lt;CR&gt;&lt;LF&gt;</td>
</tr>
<tr>
<td>SATS</td>
<td>NUMSATS</td>
<td>Sets the receiver to use altitude aiding depending upon the number of visible satellites. If there are fewer visible satellites than specified by NUMSATS, altitude aiding is used.</td>
<td>$JALT,SATS,NUMSATS&lt;CR&gt;&lt;LF&gt;</td>
</tr>
<tr>
<td>ALWAYS</td>
<td>HEIGHT</td>
<td>Sets the receiver to use altitude aiding regardless</td>
<td>$JALT,ALWAYS,HEIGHT&lt;CR&gt;&lt;LF&gt; $JALT,ALWAYS,HEIGHT,GEOID&lt;CR&gt;&lt;LF&gt;</td>
</tr>
</tbody>
</table>
To obtain a HEIGHT value to use with ALWAYS (using DGPS positions), average the HEIGHT over a period of time (the longer the time period, the more accurate this HEIGHT value). This is the ellipsoidal height.

$JALT,ALWAYS,HEIGHT<CR><LF>

If you use the height reported from the GPGGA message (this is actually geoidal and not ellipsoidal), use the following command:

$JALT,ALWAYS,HEIGHT,GEOID<CR><LF>

Receiver Response:

$>

Example:

To turn altitude aiding on to SOMETIMES with a PDOP of 5 issue the following command:

$JALT,SOMETIMES,5<CR><LF>

To turn altitude aiding on to ALWAYS using the height of 401.6 m as reported in the GPGGA message (geoidal height) issue the following command:

$JALT,ALWAYS,401.6,GEOID<CR><LF>

Additional Information:

To query the receiver for the current setting, issue the JSHOW command. For example, if you issue the following command:

$JALT,ALWAYS,404.2<CR><LF>

...then issuing the JSHOW command displays the following as part of its output:

$>JSHOW,ALT,ALWAYS,404.2

Topic Last Updated: v1.03 / January 11, 2012
JAPP Command

Command Type:
General Operation and Configuration

Description:
Specify which of the installed applications should be utilized or query the receiver for the currently installed applications. All modern versions of Hemisphere receivers have MFA firmware. However, you can use this command if you have 2 different versions of firmware installed. For example, if you update the firmware on application 1 and your receiver still shows you have the previous version of firmware installed, check to see if you are in application 2, or vice-versa.

Specify receiver application firmware (when two applications are present)

Command Format:
$JAPP,OTHER<CR><LF> or $JAPP,O<CR><LF>
(the second command uses the letter O, not a zero) or
$JAPP,x<CR><LF>
where ‘x’ is either 1 (application in slot 1) or 2 (application in slot 2)

Query receiver application firmware:
$JAPP<CR><LF>

Receiver Response:
For example, if WAAS (SBAS) and AUTODIFF (e-Dif) are the two installed applications (WAAS in slot1 and AUTODIFF in slot2) and WAAS is the current application, if you issue the $JAPP,OTHER<CR><LF>command on a receiver, the response to $JAPP<CR><LF> will be $>JAPP,AUTODIFF,WAAS,2,1, indicating that application slot 2 (e-Dif) is currently being used.

Hemisphere GNSS recommends that you follow up the sending of these commands with a $JAPP query to see which application is 1 or 2. It is best to use these two commands when upgrading the firmware inside the receiver, because the firmware upgrading utility uses the application number to designate which application to overwrite.

Response to querying the current setting:
$>JAPP,CURRENT,OTHER,[1 OR 2],[2 OR 1]

where:

• ‘CURRENT’ indicates the current application in use
• ‘OTHER’ indicates the secondary application that is not currently in use
• 1 and 2 indicate in which application slots the applications reside

Example:
If the response to:
$JAPP<CR><LF>
is $>JAPP,W AAS,AUTODIFF,1,2,
this indicates:
• WAAS (SBAS) is the current application and is in application slot 1
• e-Dif is the other application (not currently used) and is in application slot 2

Additional Information:
When querying the current setting, the following application names may appear (depending on your product):

- Crescent
- WAAS – Changes to the SBAS application. For the sake of the application names, the SBAS application is referred to as WAAS by the receiver’s internal firmware
- AUTODIFF – Changes to the e-Dif application. Referred to as “AUTODIFF” in the receiver’s internal firmware
- LOCRTK – Changes to the local differential rover application
- RTKBAS – Changes to the local differential base application
- LBAND – Changes to Atlas DGPS service
- Eclipse
- WAASRTKB – Changes to the SBAS/RTK Base application
- LBAND – Changes to Atlas DGPS service
- RTK – Changes to the RTK Rover application
- Eclipse II
- SBASRTKB – Changes to the SBAS/L-band/RTK Base application
- AUTODIFF – Changes to the e-Dif application, referred to as “AUTODIFF” in the firmware
- RTK – Changes to the RTK Rover application
- MFA - Multi-function application
- miniEclipse
- WAASRTKB – Changes to the SBAS/RTK Base application
- AUTODIFF – Changes to the e-Dif application, referred to as “AUTODIFF” in the firmware
- RTK – Changes to the RTK Rover application
- MFA - Multi-function application

## JASC Commands

### JASC Command

The JASC command is used to request ASCII messages.

<table>
<thead>
<tr>
<th>Command</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>JASC,CMR</td>
<td>Set the proprietary CMR messages to on or off to provide corrections to the rover</td>
</tr>
<tr>
<td>JASC,D1 (RD1)</td>
<td>Set the RD1 diagnostic information message from the receiver to on or off</td>
</tr>
<tr>
<td>JASC,DFX</td>
<td>Set the proprietary DFX messages to on or off to provide corrections to the rover</td>
</tr>
<tr>
<td>JASC,GL</td>
<td>Enable the GLONASS data messages at a particular update rate to be turned on or off. When turning messages on, various update rates are available depending on the requirements.</td>
</tr>
<tr>
<td>JASC,GN</td>
<td>Enable the GNSS data messages at a particular update rate to be turned on or off. When turning messages on, various update rates are available depending on the requirements.</td>
</tr>
<tr>
<td>JASC,GP</td>
<td>Enable the GPS data messages at a particular update rate to be turned on or off</td>
</tr>
<tr>
<td>JASC,HPR</td>
<td>Configure the receiver to output UTC time, heading, pitch, and roll. Pitch and roll will come from the antenna array, one from internal sensor, for more information refer to JATT, ROLL</td>
</tr>
<tr>
<td>JASC,INTLT</td>
<td>Configure the receiver to output pitch and roll data</td>
</tr>
<tr>
<td>JASC,PASHR</td>
<td>Configure the receiver to output time, true heading, roll, and pitch data in one message</td>
</tr>
<tr>
<td>JASC,PSAT,ATTSTAT</td>
<td>Configure the receiver to output the information of secondary antenna</td>
</tr>
<tr>
<td>JASC,PSAT,BLV.1</td>
<td>Configure the receiver to output the North,East,Up base-line vector</td>
</tr>
<tr>
<td>JASC,PSAT,FVI.1</td>
<td>Configure the receiver to output a message include most position and attitude information</td>
</tr>
<tr>
<td>JASC,PSAT,RTKPROG</td>
<td>Configure the receiver to output RTK fix progress</td>
</tr>
<tr>
<td>JASC,PSAT,RTKSTAT</td>
<td>Configure the receiver to output the most relevant parameters affecting RTK</td>
</tr>
<tr>
<td>JASC,PTSS1</td>
<td>Configure the receiver to output the heading, pitch, roll, and master to slave vector</td>
</tr>
<tr>
<td>JASC,ROX</td>
<td>Set the proprietary ROX messages to on or off to provide corrections to the rover</td>
</tr>
<tr>
<td>JASC,RTCM</td>
<td>Configure the receiver to output RTCM version 2 DGPS corrections from SBAS or beacon through either receiver serial port</td>
</tr>
<tr>
<td>JASC,RTCM3</td>
<td>Set the RTCM version 3 messages to on or off to provide corrections to the rover</td>
</tr>
<tr>
<td>JASC,VIRTUAL</td>
<td>Configure the receiver to have RTCM data input on one port and output through the other (when using an external correction source)</td>
</tr>
</tbody>
</table>

Topic Last Updated: v2.0/ April 30, 2019
JASC,CMR Command

Command Type:
Local Differential and RTK

Description:
Set the proprietary CMR messages to on or off to provide corrections to the rover.

This command only applies to an Eclipse base station receiver when using GPS dual frequency RTK mode. RTK is relative to the reference position (base only).

Command Format:

where:

$JASC,CMR,r[,OTHER]<CR><LF>

- 'r' = correction status variable (0 = turn corrections Off, 1 = turn corrections On)
- '.OTHER' = optional field, enacts a change on the current port when you send the command without it (and without the brackets) and enacts a change on the other port when you send the command with it (without the brackets). See Configuring the Data Message Output for detailed information on 'THIS' and 'OTHER' port terminology.

Receiver Response:
$>

Example: To turn on CMR messages on the OTHER port issue the following command:

$JASC,CMR,1,OTHER<CR><LF>

Additional Information:
To query the receiver for the current setting, issue the $SHOW command. To change the broadcast station ID, use $RTK.<n>

Topic Last Updated: v1.02 / January 25, 2011
JASC,D1 Command

Command Type:
General Operation and Configuration, SBAS

Description:
Set the RD1 diagnostic information message from the receiver to on or off There is currently only an (R)D1 message. This contains diagnostic information for L-band.

Command Format:
where:

$JASC,D1,[r[,OTHER]]<CR><LF>

- 'r' = message rate (0 = Off, 1 = On at 1Hz)
- ',OTHER' = optional field, enacts a change in the RD1 message on the current port when you send the command without it (and without the brackets) and enacts a change in the RD1 message on the other port when you send the command with it (without the brackets). See Configuring the Data Message Output for detailed information on 'THIS' and 'OTHER' port terminology.

Receiver Response:

$>

Example:

To output the RD1 message once per second from THIS port issue the following command:

$JASC,D1,1<CR><LF>

...and the output will look similar to the following:

$RD1,410213,1052,1551.489,1,0,39,- 611.5,0,1F,1F,0,999999
$RD1,410214,1052,1551.489,1,0,40,- 615.1,0,1F,1F,0,999999
$RD1,410215,1052,1551.489,1,0,40,- 607.1,0,1F,1F,0,999999

See RD1 message for a description of each field in the response.

Additional Information:

Although you request D1 through this command the responding message is RD1.

To query the receiver for the current setting, issue the JSHOW command. For example, if you issue the following command:

$JASC,D1,1<CR><LF>

...then issuing the JSHOW command displays the following as part of its output:

$>JSHOW,ASC,D1,1

Topic Last Updated: v2.0/ April 30, 2019
JASC,DFX Command

Command Type:
Local Differential and RTK

Description:
Set the proprietary DFX messages to on or off to provide corrections to the rover

This command only applies to a Crescent base receiver when using L-Dif or RTK mode. Differential is relative to the reference position (base only). See the JASC,RXX command for the equivalent message for the Eclipse series of products.

Command Format:
$JASC,DFX,r[,OTHER]<CR><LF>

where:

- ‘r’ = correction status variable (0 = turn corrections Off, 1 = turn corrections On)
- ‘,OTHER’ = optional field, enacts a change on the current port when you send the command without it (and without the brackets) and enacts a change on the other port when you send the command with it (without the brackets). See Configuring the Data Message Output for detailed information on ‘THIS’ and ‘OTHER’ port terminology.

Receiver Response:
>

Example:
To turn on DFX messages on THIS port issue the following command:
$JASC,DFX,1<CR><LF>

Additional Information:
To query the receiver for the current setting, issue the JSHOW command. To change the broadcast station ID, use JRKT28.

Topic Last Updated: v1.02 / January 25, 2011
JASC, GL Command

Command Type:

GLONASS

Description:

Enable the GLONASS data messages at a particular update rate to be turned on or off. When turning messages on, various update rates are available depending on the requirements.

Command Format:

$JASC, msg, r[, OTHER]<CR><LF>

Where:

- 'msg' = name of the data message
- 'r' = message rate (see table below)

*'*', 'OTHER' = optional field, enacts a change on the current port (THIS port) when you send the command without it (and without the brackets) and enacts a change on the other port (OTHER port) when you send the command with it (without the brackets). See Configuring the Data Message Output for detailed information on 'THIS' and 'OTHER' port terminology.

Send a command with a zero value for the 'R' field to turn off a message.

<table>
<thead>
<tr>
<th>MSG</th>
<th>R (rate in Hz)</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>GLMLA</td>
<td>1 (on) or 0 (off)</td>
<td>GLONASS almanac data</td>
</tr>
<tr>
<td></td>
<td>When set to on the message is sent once (one message for each tracked satellite) and then sent again whenever satellite information changes</td>
<td></td>
</tr>
<tr>
<td>GLGSV</td>
<td>1 or 0</td>
<td>GLONASS satellite in view</td>
</tr>
</tbody>
</table>

Receiver Response:

$>

Example:

To output the GLGNS message through the OTHER port at a rate of 20 Hz, issue the following command:

$JASC, GLGNS, 20, OTHER<CR><LF>

Additional Information:

The status of this command is also output in the JSHOW message. What does <CR><LF> mean?

Topic Last Updated: v1.02 / January 25, 2011
JASC,GA Command

Command Type:
GALILEO

Description:
Enable the GALILEO data messages at a particular update rate to be turned on or off. When turning messages on, various update rates are available depending on the requirements.

Command Format:
$JASC,msg,r[,OTHER]<CR><LF>

where:
- ‘msg’ = name of the data message
- ‘r’ = message rate (see table below)

‘,OTHER’ = optional field, enacts a change on the current port (THIS port) when you send the command without it (and without the brackets) and enacts a change on the other port (OTHER port) when you send the command with it (without the brackets). See Configuring the Data Message Output for detailed information on ‘THIS’ and ‘OTHER’ port terminology.

Send a command with a zero value for the ‘R’ field to turn off a message.

<table>
<thead>
<tr>
<th>MSG</th>
<th>R (rate in Hz)</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>GNGNS</td>
<td>20, 10, 2, 1, 0 or .2</td>
<td>All GNSS fix data (GAGNS output is GALILEO)</td>
</tr>
<tr>
<td>GAGSV</td>
<td>1 or 0</td>
<td>GALILEO satellites in view</td>
</tr>
</tbody>
</table>

Receiver Response:
$>

Additional Information:
The status of this command is also output in the JSHOW message. What does <CR><LF> mean?

Topic Last Updated: v1.07 / February 16, 2017
JASC,GQ Command

Command Type:
QZSS

Description:
Enable the QZSS data messages at a particular update rate to be turned on or off.

Command Format:
$JASC,msg,r[,OTHER]<CR><LF>

where:
- 'msg' = name of the data message
- 'r' = message rate (see table below)

'OTHER' = optional field, enacts a change on the current port (THIS port) when you send the command without it (and without the brackets) and enacts a change on the other port (OTHER port) when you send the command with it (without the brackets). See Configuring the Data Message Output for detailed information on 'THIS' and 'OTHER' port terminology.

Send a command with a zero value for the 'R' field to turn off a message.

<table>
<thead>
<tr>
<th>MSG</th>
<th>R (rate in Hz)</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>GQGSV</td>
<td>1 or 0</td>
<td>QZSS satellites in view</td>
</tr>
</tbody>
</table>

Receiver Response:
$>

Example:
To output the GQGSV message through the OTHER port, issue the following command:
$JASC,GQGSV,1,OTHER<CR><LF>

Additional Information:
The status of this command is also output in the JSHOW message. What does <CR><LF> mean?

Topic Last Updated: v2.0/ April 30, 2019
JASC, GN Command

Command Type:
GPS, Vector

Description:
Enable the GNSS data messages at a particular update rate to be turned on or off. When turning messages on, various update rates are available depending on the requirements.

Command Format:
$JASC,msg,r[,OTHER]<CR><LF>

where:
- ‘msg’ = name of the data message
- ‘r’ = message rate (see table below)
- ‘OTHER’ = optional field, enacts a change on the current port (THIS port) when you send the command without it (and without the brackets) and enacts a change on the other port (OTHER port) when you send the command with it (without the brackets). See Configuring the Data Message Output for detailed information on ‘THIS’ and ‘OTHER’ port terminology.

Send a command with a zero value for the ‘R’ field to turn off a message.

<table>
<thead>
<tr>
<th>MSG</th>
<th>R (rate in Hz)</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>GNGA</td>
<td>20, 10, 2, 1, 0 or .2</td>
<td>GNSS fix data</td>
</tr>
<tr>
<td>GNGL</td>
<td>20, 10, 2, 1, 0 or .2</td>
<td>Geographic position - latitude/longitude</td>
</tr>
<tr>
<td>GNGN</td>
<td>20, 10, 2, 1, 0 or .2</td>
<td>GNSS fix data</td>
</tr>
<tr>
<td>GNSSA</td>
<td>1 or 0</td>
<td>GNSS DOP and active satellites</td>
</tr>
</tbody>
</table>

Receiver Response:
$>

Example:
To output the GNGNS message through the OTHER port at a rate of 20 Hz, issue the following command:

$JASC,GNGNS,20,OTHER<CR><LF>

Additional Information:
The status of this command is also output in the JSHOW message. What does $<CR><LF> mean?
JASC,GP Command

Command Type:
GPS, Vector

Description:
Enable the GPS data messages at a particular update rate to be turned on or off. When turning messages on, various update rates are available depending on the requirements.

Command Format:
$JASC,msg,r[,OTHER]<CR><LF>

where:
- 'msg' = name of the data message
- 'r' = message rate (see table below)
- ',OTHER' = optional field, enacts a change on the current port (THIS port) when you send the command without it (and without the brackets) and enacts a change on the other port (OTHER port) when you send the command with it (without the brackets). See Configuring the Data Message Output for detailed information on 'THIS' and 'OTHER' port terminology.

Send a command with a zero value for the 'R' field to turn off a message.
Example:

To output the GPGGA message through the OTHER port at a rate of 20 Hz, issue the following command:

$JASC,GPGGA,20,OTHER<CR><LF>
Additional Information:

The status of this command is also output in the JSHOW message. What does <CR><LF> mean?

Topic Last Updated: v1.11 / November 15, 2018
JASC,INTLT Command

Command Type:
Vector

Description:
Configure the receiver to output pitch and roll data (pitch and roll are factory calibrated over temperature to be accurate to ±3°C) directly from the internal tilt sensor

Saved with JSAVE.

Command Format:
$JASC,INTLT,r[,OTHER]<CR><LF>

where:
- 'r' = message rate (0 = Off, 1 = On at 1Hz)
- 'OTHER' = optional field, enacts a change on the current port when you send the command without it (and without the brackets) and enacts a change on the other port when you send the command with it (without the brackets). See Configuring the Data Message Output for detailed information on 'THIS' and 'OTHER' port terminology.

Receiver Response:
$PSAT,INTLT,pitch,roll*CC<CR><LF>

where pitch and roll are in degrees

Additional Information:
PSAT,INTLT message

Topic Last Updated: v2.0/ April 30, 2019
JASC, PASHR Command

Command Type:
Vector

Description:
Configure the receiver to output time, true heading, heave, roll, and pitch data in one message

Command Format:
$JASC,PASHR,r[,OTHER]<CR><LF>

where:
- ‘r’ = message rate (0 = Off, 1 = On at 1Hz)
- ‘OTHER’ = optional field, enacts a change on the current port when you send the command without it (and without the brackets) and enacts a change on the other port when you send the command with it (without the brackets). See Configuring the Data Message Output for detailed information on ‘THIS’ and ‘OTHER’ port terminology.

Receiver Response:
$PASHR,hhmmss.ss,HHH.HH,T,RRR.RR,PPP.PP,heave,rr.rrr,pp.ppp,hh.hhh,QF*CC<CR>

where:

<table>
<thead>
<tr>
<th>Message Component</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>hhmmss.ss</td>
<td>UTC time</td>
</tr>
<tr>
<td>HHH.HH</td>
<td>Heading value in decimal degrees</td>

Example:
To turn on the PASHR message on THIS port issue the following command:

$JASC,PASHR,1<CR><LF>

...and the message output appears similar to the following:

$PASHR,162930.00,,T,2.48,3.92,-0.64,0.514,0.514,0.000,1*05
$PASHR,162931.00,,T,2.38,3.93,-0.70,0.508,0.508,0.000,1*07
$PASHR,162932.00,,T,2.67,4.00,-0.66,0.503,0.503,0.000,1*04

Additional Information:

PASHR message

Topic Last Updated: v1.06 / March 10, 2015
JASC,PSAT,ATTSTAT Command

Command Type:
Local Differential and RTK

Description:
The information of secondary antenna.

Command Format:
$JASC,PSAT,ATTSTAT,r[,OTHER]<CR><LF>

where:

- 'r' = message rate (0 = Off, 1 = On at 1Hz)
- 'OTHER' = optional field, enacts a change on the current port when you send the command without it (and without the brackets) and enacts a change on the other port when you send the command with it (without the brackets). See Configuring the Data Message Output for detailed information on 'THIS' and 'OTHER' port terminology.

Receiver Response:
$>

Example:
To turn on this message on the THIS port issue the following command:
$JASC,PSAT,ATTSTAT,1<CR><LF>

Additional Information:
Issuing the JSAVE command after setting JASC,PSAT,ATTSTAT to 1 (message on at 1Hz) does not save this setting. You must enable JASC,PSAT,ATTSTAT (set it to 1) each time you power on the receiver.

Related Commands and Messages:
PSAT,ATTSTAT message

Topic Last Updated: v. 1.07/ October 13, 2016
JASC,PSAT,BLV Command

Command Type:
Local Differential and RTK

Description:
Configure the receiver to output the North, East, Upbase-line vector

Command Format:
$JASC,PSAT,BLV,r[,OTHER]<CR><LF>

where:

- 'r' = message rate 0,1,2,5,10,20 (0 = Off, 1 = On at 1Hz)

- 'OTHER' = optional field, enacts a change on the current port when you send the command without it (and without the brackets) and enacts a change on the other port when you send the command with it (without the brackets). See Configuring the Data Message Output for detailed information on 'THIS' and 'OTHER' port terminology.

Receiver Response:
$>

Example:
To turn on this message on the THIS port issue the following command:

$JASC,PSAT,BLV,1<CR><LF>

Related Commands and Messages:
PSAT, BLV message

Topic Last Updated: v.1.07/October 13, 2016
JASC,PSAT,FVI Command

Command Type:
Local Differential and RTK

Description:
Contains information on position, standard deviation of position, heading, pitch, and roll along with standard deviations of the previous, horizontal and vertical velocities, as well as general position quality information.

Command Format:
$JASC,PSAT,FVI,r[,OTHER]<CR><LF>

where:
- 'r' = message rate 0,1,2,5,10,20 (0 = Off, 1 = On at 1Hz)
- ',OTHER' = optional field, enacts a change on the current port when you send the command without it (and without the brackets) and enacts a change on the other port when you send the command with it (without the brackets). See Configuring the Data Message Output for detailed information on 'THIS' and 'OTHER' port terminology.

Receiver Response:
$>

Example:
To turn on this message on the THIS port issue the following command:
$JASC,PSAT,FVI,1<CR><LF>

Related Commands and Messages:
PSAT, FVI message

Topic Last Updated: v2.0/ April 30, 2019
JASC,PSAT,RTKPROG Command

Command Type:
Local Differential and RTK

Description:
Configure the receiver to output RTK fix progress

Command Format:
$JASC,PSAT,RTKPROG,r[,OTHER]<CR><LF>

where:

• 'r' = message rate (0 = Off, 1 = On at 1Hz)

• ','OTHER' = optional field, enacts a change on the current port when you send the command without it (and without the brackets) and enacts a change on the other port when you send the command with it (without the brackets). See Configuring the Data Message Output for detailed information on 'THIS' and 'OTHER' port terminology.

You can also perform a one-time query of the message information by issuing the JQuery,RTKPROG command.

Receiver Response:
$>

Example:
To turn on this message on the THIS port issue the following command:

$JASC,PSAT,RTKPROG,1<CR><LF>

Additional Information:
Issuing the JSAVE command after setting JASC,PSAT,RTKPROG to 1 (message on at 1Hz) does not save this setting. You must enable JASC,PSAT,RTKPROG (set it to 1) each time you power on the receiver.

See also: PSAT,RTKPROG message.

Topic Last Updated: v1.04 / May 29, 2012
JASC,PSAT,RTKSTAT Command

Command Type:
Local Differential and RTK

Description:
Configure the receiver to output the most relevant parameters affecting RTK

Command Format:
$JASC,PSAT,RTKSTAT,r[,OTHER]<CR><LF>

where:
• 'r' = message rate (0 = Off, 1 = On at 1Hz)
• ',OTHER' = optional field, enacts a change on the current port when you send the command without it (and without the brackets) and enacts a change on the other port when you send the command with it (without the brackets). See Configuring the Data Message Output for detailed information on 'THIS' and 'OTHER' port terminology.

You can also perform a one-time query of the message information by issuing the JQUERY,RTKSTAT command.

Receiver Response:
$>

Example:
To turn on this message on the THIS port issue the following command:
$JASC,PSAT,RTKSTAT,1<CR><LF>

Additional Information:
Issuing the JSAVE command after setting JASC,PSAT,RTKSTAT to 1 (message on at 1Hz) does not save this setting. You must enable JASC,PSAT,RTKSTAT (set it to 1) each time you power on the receiver.

Related Commands and Messages:

JASC,ROX Command

Command Type:
Local Differential and RTK

Description:
Set the proprietary ROX messages to on or off to provide corrections to the rover

This command only applies to an Eclipse base station receiver when using GPS dual frequency RTK mode. RTK is relative to the reference position (base only).

Command Format:
$JASC,ROX,r[,OTHER]<CR><LF>

where:

•  ‘r’ = correction status variable (0 = turn corrections Off, 1 = turn corrections On)

•  ‘,OTHER’ = optional field, enacts a change on the current port when you send the command without it (and without the brackets) and enacts a change on the other port when you send the command with it (without the brackets). See Configuring the Data Message Output for detailed information on ‘THIS’ and ‘OTHER’ port terminology.

Receiver Response:
$>

Example:
To turn on ROX messages on the OTHER port issue the following command:
$JASC,ROX,1,OTHER<CR><LF>

Additional Information:
To query the receiver for the current setting, issue the JSHOW command. To change the broadcast station ID, use JRTK,28.
JASC,RTCM Command

Command Type:
SBAS

Description:
Configure the receiver to output RTCM version 2 DGPS corrections from SBAS or beacon through either receiver serial port. The correction data output is RTCM SC-104, even though SBAS uses a different over-the-air protocol (RTCA).

Command Format:
$JASC,RTCM,r,[OTHER]\<CR><LF>

where:

- 'r' = message status variable (0 = Off, 1 = On)
- ',OTHER' = optional field, enacts a change on the current port when you send the command without it (and without the brackets) and enacts a change on the other port when you send the command with it (without the brackets). See Configuring the Data Message Output for detailed information on 'THIS' and 'OTHER' port terminology.

Receiver Response:
$>

Example:
To output RTCM corrections from SBAS or beacon on THIS port (current port) issue the following command:

$JASC,RTCM,1\<CR><LF>

Additional Information:
To verify the current setting is on, issue the JSHOW command. You will see output similar to the following:

$>JSHOW,ASC,RTCM,1.0

If the current setting is off, the JSHOW command will not show any information for this setting.

Topic Last Updated: v1.02 / January 25, 2011
**JASC,RTCM3 Command**

**Command Type:**

Local Differential and RTK

**Description:**

Set the RTCM version 3 messages to on or off to provide corrections to the rover

This command only applies to an Eclipse base station receiver when using GPS dual frequency RTK mode. RTK is relative to the reference position (base only).

**Command Format:**

$JASC,RTCM3,r[,OTHER]<CR><LF>

where:

- ‘r’ = correction status variable (0 = turn corrections Off, 1 = turn corrections On)
- ‘,OTHER’ = optional field, enacts a change on the current port when you send the command without it (and without the brackets) and enacts a change on the other port when you send the command with it (without the brackets). See Configuring the Data Message Output for detailed information on ‘THIS’ and ‘OTHER’ port terminology.

**Receiver Response:**

$>

**Example:**

To turn on RTCM3 messages on the OTHER port issue the following command:

$JASC,RTCM3,1,OTHER<CR><LF>

**Additional Information:**

To query the receiver for the current setting, issue the JSHOW command. To change the broadcast station ID, use JRTK28.

Topic Last Updated: v1.02 / January 25, 2011
JASC, VIRTUAL Command

Command Type:
General Operation and Configuration

Description:
Configure the receiver to have RTCM data input on one port and output through the other (when using an external correction source)

For example, if RTCM is input on Port B, the data will be output through Port A having corrected the receiver position. The receiver acts as a pass-through for the RTCM data. Either port may be configured to accept RTCM data input; this command enables the opposite port to output the RTCM data.

Command Format:
$JASC, VIRTUAL,r[,OTHER]<CR><LF>

where:
• 'r' = message status variable (0 = Off, 1 = On)
• 'OTHER' = optional field, enacts a change on the current port when you send the command without it (and without the brackets) and enacts a change on the other port when you send the command with it (without the brackets). See Configuring the Data Message Output for detailed information on 'THIS' and 'OTHER' port terminology.

Receiver Response:
$>

Example:
To configure THIS port to output RTCM messages that are being input through the OTHER port issue the following command:

$JASC, VIRTUAL, 1

Additional Information:
Topic Last Updated: v1.02 / January 25, 2011
JATLAS Commands

JATLAS,LIMIT Command

Command Type:
L-band

Description:
When using Atlas, configure the accuracy threshold for when the GPGGA quality indicator reports a Fix.

Command Format:

$JATLAS,LIMIT,[OPTION],[THRESHOLD],SAVE<CR><LF>

where:
· [THRESHOLD] is in meters
· The SAVE field is optional. However, if omitted this setting will not survive a power cycle. $JSAVE does not save this setting.
· Options are 3D, HORIZ, or VERT

To configure the receiver so that it reports an RTK fix when the Atlas solution has converged to 3D accuracy of 30cm, send:

$JATLAS,LIMIT,3D,0.3,SAVE<CR><LF>

Query the current setting:

$JATLAS,LIMIT<CR><LF>

Receiver Response:

Response to issuing command to tune receiver:

$>
$JATLAS,POS,PRESENT [,OTHER]

Command Type:
ATLAS

Description:
Saves the current location and associated standard deviations into nonvolatile memory (provided that the present position is sufficiently stable), to be used with Atlas position seeding.

Use of “OTHER” saves the position that is used by the Atlas Autoseed algorithm; otherwise, saves the position that is used for manual position seeding.

Command Format:
$JATLAS,POS,PRESENT [,OTHER] <CR><LF>

Query the current setting:
See $JATLAS,POS[ ,OTHER]

Receiver Response:
If the present position is stable, the response is:
$>

If the present position is not stable, the command is ignored and the response is:
Present Location Not Stable

Example:

Additional Information:
See $JATLAS,MODE,AUTOSEED and $JATLAS,SEED for additional information about position seeding.

Topic Last Updated: v.3.0/ December 30, 2019
$JATLAS,POS[,OTHER]

**Command Type:**

ATLAS

**Description:**

Query the receiver for the stored position and standard deviations to be used with Atlas position seeding.

Use of "OTHER" displays the position that is used by the Atlas Autoseed algorithm; otherwise, displays the position that is used for manual position seeding.

**Command Format:**

$JATLAS,POS[,OTHER] <CR><LF>

**Query the current setting:**

**Receiver Response:**

$>JATLAS,POS,lat,lon,hgt,(LatStDev,LonStDev,HgtStDev)

where:

<table>
<thead>
<tr>
<th>Command Component</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>lat</td>
<td>Latitude in decimal degrees</td>
</tr>
<tr>
<td>lon</td>
<td>Longitude in decimal degrees</td>
</tr>
<tr>
<td>hgt</td>
<td>Ellipsoidal height in meters. Ellipsoidal height can be calculated by adding the altitude and the geoidal separation, both available from the GPGGA message. Example: $GPGGA,173309.00,5101.04028,N,11402.38289,W,2,07,1.4,1071.0,M,-17.8,M,0122*48 ellipsoidal height = 1071.0 + (-17.8) = 1053.2 meters</td>
</tr>
<tr>
<td>LatStDev</td>
<td>Standard deviation of latitude in meters</td>
</tr>
<tr>
<td>LonStDev</td>
<td>Standard deviation of longitude in meters</td>
</tr>
<tr>
<td>HgtStDev</td>
<td>Standard deviation of height in meters</td>
</tr>
</tbody>
</table>

**Example:**

A response to querying the saved position would look like:

$>JATLAS,POS,33.64334383,-111.89596094,455.244,(0.062,0.086,0.156)

**Additional Information:**

See $JATLAS,MODE,AUTOSEED and $JATLAS,SEED for additional information about position seeding.

Topic Last Updated: v.3.0 /December 30, 2019
**$JATLAS,POS,lat,lon,hgt[,LatStDev,LonStDev,HgtStDev][,OTHER]**

**Command Type:**

ATLAS

**Description:**

Saves the input position and optionally the corresponding standard deviation into non-volatile memory, to be used with Atlas position seeding.

Use of "OTHER" saves the position that is used by the Atlas Autoseed algorithm; otherwise, saves the position that is used for manual position seeding.

**Command Format:**

$JATLAS,POS,lat,lon,hgt,[LatStDev,LonStDev,HgtStDev][,OTHER]<CR><LF>

where:

<table>
<thead>
<tr>
<th>Command Component</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>lat</td>
<td>Latitude in decimal degrees</td>
</tr>
<tr>
<td>lon</td>
<td>Longitude in decimal degrees</td>
</tr>
<tr>
<td>hgt</td>
<td>Ellipsoidal height in meters. Ellipsoidal height can be calculated by adding the altitude and the geoidal separation, both available from the GPGGA message. Example: $GPGGA,173309.00,5101.04028,N,11402.38289,W,2,07,1.4,1071.0,M,-17.8,M,6.0,0122*48 ellipsoidal height = 1071.0 + (-17.8) = 1053.2 meters</td>
</tr>
<tr>
<td>LatStDev</td>
<td>Standard deviation of latitude in meters [optional]</td>
</tr>
<tr>
<td>LonStDev</td>
<td>Standard deviation of longitude in meters [optional]</td>
</tr>
<tr>
<td>HgtStDev</td>
<td>Standard deviation of height in meters [optional]</td>
</tr>
</tbody>
</table>

**Query the current setting:**

See $JATLAS,POS[,OTHER]

**Receiver Response:**

$>

**Example:**

$JATLAS,POS,33.64334383,-111.89596094,455.244,0.062,0.086,0.156<CR><LF>

**Additional Information:**

See $JATLAS,MODE,AUTOSEED and $JATLAS,SEED for additional information about position seeding.

Topic Last Updated: v.3.0 / December 30, 2019
$JATLAS,SEED[,OTHER]

Command Type:
ATLAS

Description:
Manually seed the Atlas solution with the saved position and standard deviations.

Use of “OTHER” seeds the position using the location stored for the Atlas Autoseed algorithm; otherwise, seeds using the location stored for manual position seeding.

Command Format:
$JATLAS,SEED[,OTHER] <CR><LF>

Query the current setting:

Receiver Response:
$>

If the seed position is not close enough to the current location, the response is:

$>JATLAS,SEED,Current Position Too Far From Seed

Example:

Additional Information:

Position seeding can reduce Atlas convergence time by supplying the engine with a known position at initialization.

Warning: Manual seeding should be used with caution, as any errors entered here will affect the future accuracy of the position solution. The seed position coordinates should generally be known to within several centimeters before attempting to seed the position.

See also $JATLAS,MODE,AUTOSEED, which handles the Atlas position seeding automatically.

Topic Last Updated: v.3.0 / December 30, 2019
$JATLAS,SEED,lat,lon,hgt[,LatStDev,LonStDev,HgtStDev]

Command Type:
ATLAS

Description:
Manually seed the Atlas solution with the input position and optionally standard deviations.

Command Format:
$JATLAS,SEED,lat,lon,hgt,[LatStDev,LonStDev,HgtStDev]<CR><LF>

where:

<table>
<thead>
<tr>
<th>Command Component</th>
<th>Description</th>
</tr>

<tr>
<td>lat</td>
<td>Latitude in decimal degrees</td>
</tr>
<tr>
<td>lon</td>
<td>Longitude in decimal degrees</td>
</tr>
<tr>
<td>hgt</td>
<td>Ellipsoidal height in meters. Ellipsoidal height can be calculated by adding the altitude and the geoidal separation, both available from the GPGGA message. Example: $GPGGA,173309.00,5101.04028,N,11402.38289,W,2,07,1.4,1071.0,M,-17.8,M,6.0,0122*48 ellipsoidal height = 1071.0 + (-17.8) = 1053.2 meters</td>
</tr>
<tr>
<td>LatStDev</td>
<td>Standard deviation of latitude in meters [optional]</td>
</tr>
<tr>
<td>LonStDev</td>
<td>Standard deviation of longitude in meters [optional]</td>
</tr>
<tr>
<td>HgtStDev</td>
<td>Standard deviation of height in meters [optional]</td>
</tr>
</tbody>
</table>

Query the current setting:

Receiver Response:

$>

If the input coordinates are not close enough to the current location, the response is:

$>JATLAS,SEED,Current Position Too Far From Seed
**Example:**

```
$JATLAS,SEED,33.64334383,-111.89596094,455.244,0.062,0.086,0.156<CR><LF>
```

**Additional Information:**

Position seeding can reduce Atlas convergence time by supplying the engine with a known position at initialization.

**Warning:** Manual seeding should be used with caution, as any errors entered here will affect the future accuracy of the position solution. The seed position coordinates should generally be known to within several centimeters before attempting to seed the position.

See also `$JATLAS,MODE,AUTOSEED`, which handles the Atlas position seeding automatically.

Topic Last Updated: v.3.0 / December 30, 2019
$JATLAS,MODE,AUTOSEED[,YES/NO]

Command Type:
ATLAS

Description:
Enable or disable the Atlas AUTOSEED feature, or query the current setting.

Command Format:
To enable the AUTOSEED feature:
$JATLAS,MODE,AUTOSEED,YES<CR><LF>
To disable the AUTOSEED feature:
$JATLAS,MODE,AUTOSEED,NO<CR><LF>
Query the current setting:
$JATLAS,MODE,AUTOSEED<CR><LF>

Receiver Response:
Response to issuing command to enable/disable AUTOSEED feature:
$>
Response to querying the current setting:
$>JATLAS,MODE,AUTOSEED,[YES/NO]

Example:

Additional Information:
Position seeding can reduce Atlas convergence time by supplying the engine with a known position at initialization.

When AUTOSEED is enabled, receiver locations are automatically saved to memory. The last saved position will then automatically be used to seed the solution when the receiver is powered back on (under appropriate conditions—see below).

The setting for AUTOSEED mode is automatically saved to memory.

Warning: The AUTOSEED position can only be saved if the receiver has not detected motion for 5 s. It is therefore recommended that the user allow sufficient stationary time before powering off.

Warning: The antenna must not be moved after being powered off. The antenna must continue to remain stationary when powered back on and until the seeding process completes. The AUTOSEED feature may not function properly if the antenna has moved more than several centimeters during this time.

Topic Last Updated: v.3.0 / December 30, 2019
$JATLAS,RESET,ENGINE

Description:
The $JATLAS,RESET,ENGINE command resets the Atlas engine

Command Type:
ATLAS

Description:
Reset the Atlas engine, forcing the solution to re-converge.

Command Format:
$JATLAS,RESET,ENGINE

Query the current setting:

Receiver Response:
$

Example:

Additional Information:
Topic Last Updated: v.3.0 / December 30, 2019
$JATLAS,STATUS,AUTOSEED

Command Type:
ATLAS

Description:
The $JATLAS,STATUS,AUTOSEED command displays the status of the AUTOSEED initialization process.

Description:
Displays the status of the Atlas AUTOSEED initialization process.

Command Format:

$JATLAS,STATUS,AUTOSEED<CR><LF>

Query the current setting:

Receiver Response:

$>JATLAS,STATUS,AUTOSEED,status

where 'status' is one of following:

<table>
<thead>
<tr>
<th>Status</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>NoAtlas</td>
<td>Autoseeding cannot occur because the Atlas solution is not available.</td>
</tr>
<tr>
<td>Disabled</td>
<td>Autoseed mode is not enabled.</td>
</tr>
<tr>
<td>Seeding</td>
<td>Autoseeding is in process.</td>
</tr>
<tr>
<td>Failed_NoSeed</td>
<td>Autoseeding failed because no seed position is available.</td>
</tr>
<tr>
<td>Failed_Moved</td>
<td>Autoseeding failed because receiver motion was detected during the seeding process.</td>
</tr>
<tr>
<td>Failed_Timeout</td>
<td>Autoseeding failed to complete within the required time.</td>
</tr>
<tr>
<td>Success</td>
<td>Autoseeding was successful.</td>
</tr>
</tbody>
</table>

Example:

Additional Information:

See also $JATLAS,MODE,AUTOSEED for additional information about Atlas Autoseed.

## JATT Commands

### JATT

The JATT command is used to define or query attitude settings for Vector products.

<table>
<thead>
<tr>
<th>Command</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>JATT.COGTAU</td>
<td>Set the course over ground (COG) time constant (0.0 to 3600.0 seconds) or query the current setting</td>
</tr>
<tr>
<td>JATT.CSEP</td>
<td>Query to retrieve the current separation between GPS antennas</td>
</tr>
<tr>
<td>JATT.EXACT</td>
<td>Enable/disable internal filter reliance on the entered antenna separation or query the current setting</td>
</tr>
<tr>
<td>JATT.FLIPBD</td>
<td>Allow upside down installation</td>
</tr>
<tr>
<td>JATT.GYROAID</td>
<td>Turn on gyro aiding or query the current feature status</td>
</tr>
<tr>
<td>JATT.HBIAS</td>
<td>Set the heading bias or query the current setting</td>
</tr>
<tr>
<td>JATT.HELP</td>
<td>Show the available commands for GPS heading operation and status</td>
</tr>
<tr>
<td>JATT.HIGHMP</td>
<td>Set/query the high multipath setting for use in poor GPS environments</td>
</tr>
<tr>
<td>JATT.HRTAU</td>
<td>Set the rate of turn time constant or query the current setting</td>
</tr>
<tr>
<td>JATT.HTAU</td>
<td>Set the heading time constant or query the current setting</td>
</tr>
<tr>
<td>JATT.LEVEL</td>
<td>Turn on level operation or query the current feature status</td>
</tr>
<tr>
<td>JATT.MOVEBASE</td>
<td>Set the auto GPS antenna separation or query the current setting</td>
</tr>
<tr>
<td>JATT.MSEP</td>
<td>Set (manually) the GPS antenna separation or query the current setting</td>
</tr>
<tr>
<td>JATT.NEGTILT</td>
<td>Turn on the negative tilt feature or query the current setting</td>
</tr>
<tr>
<td>JATT.NMEAHE</td>
<td>Instruct the Vector to preface the HDG, HDT, ROT and THS messages with GP or HE, and the HDM message with GP or HC.</td>
</tr>
<tr>
<td>JATT.PBIAS</td>
<td>Set the pitch bias or query the current setting</td>
</tr>
<tr>
<td>JATT.PTAU</td>
<td>Set the pitch time constant or query the current setting</td>
</tr>
<tr>
<td>JATT.ROLL</td>
<td>Configure the Vector for roll or pitch output</td>

Topic Last Updated: v1.09 / January 8, 2018
JATT,COGTAU Command

Note: The JTAU,COG command provides identical functionality but works with positioning and heading products.

Command Type:
Vector

Description:
Set the course over ground (COG) time constant (0.0 to 200.0 seconds) or query the current setting.

This command allows you to adjust the level of responsiveness of the COG measurement provided in the GPVTG message. The default value is 0.0 seconds of smoothing. Increasing the COG time constant increases the level of COG smoothing.

COG is computed using only the primary GPS antenna (when using a multi-antenna system) and its accuracy depends upon the speed of the vessel (noise is proportional to 1/speed). This value is invalid when the vessel is stationary, as tiny movements due to calculation inaccuracies are not representative of a vessel’s movement.

Command Format:
Set the COG time constant:
$JATT,COGTAU,cogtau<CR><LF>
where 'cogtau' is the new COG time constant that falls within the range of 0.0 to 200.0 seconds

The setting of this value depends upon the expected dynamics of the Crescent. If the Crescent will be in a highly dynamic environment, this value should be set lower because the filtering window would be shorter, resulting in a more responsive measurement. However, if the receiver will be in a largely static environment, this value can be increased to reduce measurement noise.

Query the current setting:
$JATT,COGTAU<CR><LF>

Receiver Response:
$>

Additional Information:
You can use the following formula to determine the COG time constant: cogtau (in seconds) = 10 / maximum rate of change of course (in °/s).

If you are unsure about the best value for this setting, it is best to be conservative and leave it at the default setting of 0.0 seconds.

Topic Last Updated: v2.0/ April 30, 2019
JATT,CSEP Command

Command Type:
Vector

Description:
Query the Vector for the current calculated separation between antennas, as solved for by the attitude algorithms

Command Format:
$JATT,CSEP<CR><LF>

Receiver Response:
$>

$>JATT,X,CSEP

where 'X' is the antenna separation in meters

Additional Information:
Topic Last Updated: v1.06 / March 10, 2015
JATT,EXACT Command

Command Type:
Vector

Description:
Enabling forces the heading calculation to rely on the MSEP value (see $JATT,MSEP).
Disabling forces the heading calculation to rely on the CSEP and the MSEP values.

Command Format:
Enable/disable internal filter reliance

To enable internal filter reliance:
$JATT,EXACT,YES<CR><LF>

To disable internal filter reliance:
$JATT,EXACT,NO<CR><LF>

Query the current setting:
$JATT,EXACT<CR><LF>

Receiver Response:
$>

Additional Information:
Topic Last Updated: v2.0/April 30, 2019
JATT,FLIPBRD Command

Command Type:
Vector

Description:
Turn the flip feature on/off or query the current feature status

Allow the Vector OEM board to be installed upside down. You should use this command only with the Vector Sensor and the Vector OEM board because flipping the OEM board does not affect the antenna array that needs to remain facing upwards. When using this command, the board needs to be flipped about roll so the front still faces the front of the vessel.

For all OEM heading boards starting the H328 and H220, this command is replaced with $JATT,ACC180 and $JATT,ACC90.

Command Format:

Turn the flip feature on/off

To turn the flip feature on:

$JATT,FLIPBRD,YES<CR><LF>

To turn the flip feature off (return to default mode - right side up):

$JATT,FLIPBRD,NO<CR><LF>

Query current the current setting:

$JATT,FLIPBRD<CR><LF>

Receiver Response:

$>

Additional Information:

Topic Last Updated: v3.0 / December 30, 2019
JATT,GYROAID Command

Command Type:
Vector

Description:
Turn gyro aiding on or off or query the current setting
The Vector’s internal gyro—enabled by default when shipped—offers two benefits.

It shortens reacquisition times when a GPS heading is lost because of obstruction of satellite signals. It does this by reducing the search volume required for solution of the RTK.

It provides an accurate substitute heading for a short period (depending on the roll and pitch of the vessel) ideally seeing the system through to reacquisition.

For these two benefits, Hemisphere GNSS highly recommend leaving gyro aiding on.

Exceeding rates of 90°/sec is not recommended because the gyro cannot measure rates beyond this point. This is a new recommendation since Hemisphere GNSS now uses gyro measurements to obtain a heading rate measurement.

Command Format:
Turn gyro aiding on/off
To turn gyro aiding on:
$JATT,GYROAID,YES<CR><LF>
To turn gyro aiding off:
$JATT,GYROAID,NO<CR><LF>
Query the current setting:
$JATT,GYROAID<CR><LF>

Receiver Response:
$>

Additional Information:
Every time you power up the Vector the gyro goes through a warm-up procedure and calibrates itself. You cannot save the resulting calibration, so the self-calibration takes place every time the Vector is power cycled.
This self-calibration procedure takes several minutes and is the equivalent of the following manual calibration procedure.

With the Vector unit installed:
1. Apply power and wait several minutes until it has acquired a GPS signal and is computing heading.
2. Ensure gyro aiding is on by issuing the following command: $JATT,GYROAID<CR><LF>
3. Slowly spin the unit for one minute at no more than 15°/sec.
4. Keep the unit stationary for four minutes. Both the manual and the self-calibration procedures calibrate the Crescent Vector’s gyro to the same effect.

Topic Last Updated: v1.06 / March 10, 2015
JATT,HBIAS Command

Command Type:
Vector

Description:
Set the heading output from the Vector to calibrate the true heading of the antenna array to reflect the true heading of the vessel or query the current setting

Command Format:
Set the heading output:
$JATT,HBIAS,x<CR><LF>

where 'x' is a bias that will be added to the Vector’s heading in degrees. The acceptable range for the heading bias is -180.0° to 180.0°. The default value of this feature is 0.0°.

Query the current setting (current compensation angle):
$JATT,HBIAS<CR><LF>

Receiver Response:
$>

Additional Information:

Topic Last Updated: v1.06 / March 10, 2015
JATT,HELP Command

Command Type:
Vector

Description:
Show the available commands for GPS heading operation and status

Command Format:
$JATT,HELP<CR><LF>

Receiver Response:
$>JATT,HELP,CSEP,MSEP,EXACT,LEVEL,HTAU,HRTAU,HBIASPBIA,NEGTLT,ROLL,TILTAD,
TILTCAL,MAGAID,MAGCAL,MAGCLR,GYROAID,COGTAU,SPDTAÚ,SEARCH,SUMMARY

Additional Information:
Topic Last Updated: v1.06 / March 10, 2015
JATT,HIGHMP Command

Command Type:
Vector

Description:
Enable/disable the high multipath setting for use in poor GPS environments or query the current setting.

Enabling HIGHMP mode may result in longer heading acquisition times in high multipath environments. In HIGHMP mode, the Vector will not output heading until it has good confidence in the result. In very poor environments, this may take a few minutes or more; in normal environments, there is only a slight increase in heading acquisition time.

Command Format:

Set the high multipath setting

To enable the high multipath setting:

$JATT,HIGHMP,YES<CR><LF>

To disable the high multipath setting:

$JATT,HIGHMP,NO<CR><LF>

Query the current setting:

$JATT,HIGHMP<CR><LF>

Receiver Response:

$>

Additional Information:

Topic Last Updated: v1.06 / March 10, 2015
JATT,HRTAU Command

Command Type:
Vector

Description:
Set the rate of turn (ROT) time constant to adjust the level of responsiveness of the ROT measurement provided in the GPROT message or query the current setting

The default value of this constant is 2.0 seconds of smoothing. Increasing the time constant increases the level of ROT smoothing.

Command Format:
Set the heading rate time constant:
$JATT,HRTAU,hrtau<CR><LF>

where 'hrtau' is the new time constant that falls within the range of 0.0 to seconds

The setting of this value depends upon the expected dynamics of the vessel. For example, if the vessel is very large and cannot turn quickly, increasing this time is reasonable. The resulting heading would have reduced 'noise', resulting in consistent values with time. However, artificially increasing this value such that it does not agree with a more dynamic vessel could create a lag in the ROT measurement with higher rates of turn.

Query the current setting:
$JATT,HRTAU<CR><LF>

Receiver Response:
$>

Additional Information:
You can use the following formula to determine the level of smoothing: hrtau (in seconds) = 10 / maximum rate of the rate of turn (in °/s²)

Note: If you are unsure about the best value for the setting, leave it at the default setting of 2.0 seconds.

Topic Last Updated: v1.06 / March 10, 2015
JATT,HTAU Command

Command Type:
Vector

Description:
Set the heading time constant to adjust the level of responsiveness of the true heading measurement provided in the GPHDT message or query the current setting.

For OEM boards the default value of this constant is 0.5 seconds of smoothing (regardless of whether the gyro is enabled or disabled). For finished products that implement an OEM board the default value may be different—check your product’s documentation for this value.

Although the gyro is enabled by default, you can disable it. Increasing the heading time constant increases the level of heading smoothing and increases lag only if the gyro is disabled.

Command Format:
Set the heading time constant:
$JATT,HTAU,htau<CR><LF>
where 'htau' is the new time constant that falls within the range of 0.0 to seconds

The setting of this value depends upon the expected dynamics of the vessel. If the vessel is very large and cannot turn quickly, increasing this time is reasonable. The resulting heading would have reduced ‘noise’ resulting in consistent values with time. However, artificially increasing this value such that it does not agree with a more dynamic vessel could create a lag in the heading measurement with higher rates of turn.

Query the current setting:
$JATT,HTAU<CR><LF>

Receiver Response:
$>

Additional Information:
You can use the following formula to determine level of heading smoothing required when the gyro is in use:

Gyro on
htau (in seconds) = 40 / maximum rate of turn (in °/s)

Gyro off
htau (in seconds) = 10 / maximum rate of turn (in °/s)

If you are unsure about the best value for the setting, leave it at the default setting of 2.0 seconds when the gyro is on and at 0.5 seconds when the gyro is off.

Topic Last Updated: v1.06 / March 10, 2015
**JATT,LEVEL Command**

**Command Type:**
Vector

**Description:**
Turn level operation on or off or query the current setting

If the Vector will be operated within ±10° of level, you may use this mode of operation for increased robustness and faster acquisition times of the heading solution.

**Command Format:**

**Turn level operation on/off**

To turn level operation on:

```
$JATT,LEVEL,YES<CR><LF>
```

To turn level operation off:

```
$JATT,LEVEL,NO<CR><LF>
```

**Query the current setting:**

```
$JATT,LEVEL<CR><LF>
```

**Receiver Response:**

```
$>
```

**Additional Information:**

Topic Last Updated: v1.05 / January 18, 2013
JATT,MOVEBASE Command

Command Type:
Vector

Description:
Set the auto GPS antenna separation or query the current setting

If the operation is turned on, you do not need to set the GPS antenna separation manually. Only multi-frequency boards are supported.

Command Format:

Turn move base on/off

To turn move base operation on:
$JATT,MOVEBASE,YES<CR><LF>

To turn move base operation off:
$JATT,MOVEBASE,NO<CR><LF>

Query the current setting:
$JATT,MOVEBASE<CR><LF>

Receiver Response: $>

Additional Information:

Topic Last Updated: v3.0 / December 30, 2019
JATT,MSEP Command

Command Type:

Vector

Description:
Manually enter a custom separation between antennas (must be accurate to within 2 cm) or query the current setting

Command Format:
Set the antenna separation:
Using the new center-to-center measurement, issue the following command:

$JATT,MSEP,sep<CR><LF>
where 'sep' is the measured antenna separation entered in meters

Query the current setting:

$JATT,MSEP<CR><LF>

Receiver Response:

$>

Additional Information:

Topic Last Updated: v1.06 / March 10, 2015
JATT,NEGTILT Command

Command Type:
Vector

Description:
Turn the negative tilt feature on or off or query the current setting.

When the secondary GPS antenna (SA) is below the primary GPS antenna (PA), there is an angle formed between a horizontal line through the center of the primary antenna (Line A in the diagram below) and an intersecting line through the center of the primary and secondary antennas (Line B). This angle is considered to be negative.

![Diagram showing negative angle](image)

Depending on the convention for positive and negative pitch/roll, you want to change the sign (either positive or negative) of the pitch/roll.

Command Format:

Turn negative tilt feature on/off

To change the sign of the pitch/roll measurement:

$JATT,NEGTILT,YES<CR><LF>

To return the sign of the pitch/roll measurement to its original value:

$JATT,NEGTILT,NO<CR><LF>

Query the current setting:

$JATT,NEGTILT<CR><LF>

Receiver Response:

$>

Additional Information:

Topic Last Updated: v1.06 / March 10, 2015
JATT,NMEAHE Command

Command Type:
Vector

Description:
Instruct the Vector to preface the following messages with GP or HE.

- HDG
- HDM
- HDT
- ROT

Command Format:

$JATT,NMEAHE,x<CR><LF>

where 'x' is either 1 for HE or 0 for GP

To preface specific messages with GP:

$JATT,NMEAHE,0<CR><LF>

To preface specific messages with HE:

$JATT,NMEAHE,1<CR><LF>

Receiver Response:

$>

$>JATT,NMEAHE,OK

Additional Information:

The HDM message is for a magnetic compass. The message will be HCHDM when requesting with $JATT,NMEAHE,1 specified.

Topic Last Updated: v1.06 / March 10, 2015
JATT,PBIAS Command

Command Type:
Vector

Description:
Set the pitch/roll output from the Vector to calibrate the measurement if the antenna array is not installed in a horizontal plane or query the current setting.

Command Format:
Set the pitch/roll output:

$JATT,PBIAS,x<CR><LF>

where 'x' is a bias that will be added to the Vector’s pitch/roll measure, in degrees

The acceptable range for the pitch bias is -15.0° to 15.0°. The default value is 0.0°.

Query the current setting:

$JATT,PBIAS<CR><LF>

Receiver Response:

$>

Additional Information:

Note: The pitch/roll bias is added after the negation of the pitch/roll measurement (if invoked with the JATT,NEG TILT command). Use PBIAS to describe any angular differences between the level of the two GPS antennas. Pitch is the default, but if the antennas are mounted in the roll direction, you can still enter the roll bias in PBIAS (make sure JATT,ROLL,YES is set).

Topic Last Updated: v1.06 / March 10, 2015
JATT,PTAU Command

Command Type:
Vector

Description:
Set the level of responsiveness of the pitch measurement provided in the PSAT,HPR message or query the current setting.
For OEM boards the default value of this constant is 0.5 seconds of smoothing (regardless of whether the gyro is enabled or disabled). For finished products that implement an OEM board the default value may be different—check your product's documentation for this value. Increasing the pitch time constant increases the level of pitch smoothing and increases lag.

Command Format:

Set the pitch time constant:
$\text{JATT,PTAU,ptau<CR><LF>}$
where 'ptau' is the new time constant that falls within the range of 0.0 to 3600.0 seconds.
The setting of this value depends upon the expected dynamics of the vessel. For instance, if the vessel is very large and cannot pitch quickly, increasing this time is reasonable. The resulting pitch would have reduced 'noise', resulting in consistent values with time.
However, artificially increasing this value such that it does not agree with a more dynamic vessel could create a lag in the pitch measurement.

Query the current setting:
$\text{JATT,PTAU<CR><LF>}$

Note: If you are unsure about the best value for the setting, leave it at the default setting of 0.5 seconds.

Receiver Response:
$>$

Additional Information:
You can use the following formula to determine the level of pitch smoothing required:

$\text{ptau (in seconds) = 10 / maximum rate of pitch (in °/s)}$

Topic Last Updated: v1.06 / March 10, 2015
JATT,ROLL Command

Command Type:
Vector

Description:
Configure the Vector for roll or pitch GPS antenna orientation.

Command Format:

Configure the Vector for pitch or roll GPS antenna orientation:

To configure the Vector for roll GPS antenna orientation (the Antenna Array must be installed perpendicular to the vessel’s axis):

$JATT,ROLL,YES<CR><LF>

To configure the Vector for pitch GPS antenna orientation (default):

$JATT,ROLL,NO<CR><LF>

Query the current setting:

$JATT,ROLL<CR><LF>

Receiver Response:

$>

Additional Information:

Topic Last Updated: v1.06 / March 10, 2015
JATT,SEARCH Command

Command Type:
Vector

Description:
Force the Vector to reject the current GPS heading solution and begin a new search.

Command Format:
$JATT,SEARCH<CR><LF>

Receiver Response:
$>

Additional Information:
The SEARCH function will not work if you have enabled the gyroaid feature (using the GYROAID command). In this case you must cycle power to the receiver to have a new GPS solution computed.

Topic Last Updated: v1.06 / March 10, 2015
JATT,SPDTAU Command

Note: The JTAU,SPEED command provides identical functionality but works with Crescent and Eclipse products in addition to Crescent Vector products.

Command Type:
Vector

Description:
Set the speed time constant (0.0 to 3600.0 seconds) or query the current setting.

This command allows you to adjust the level of responsiveness of the speed measurement provided in the GPVTG message. The default value is 0.0 seconds of smoothing. Increasing the speed time constant increases the level of speed measurement smoothing.

Command Format:

Set the speed time constant:

$JATT,SPDTAU,spdtau<CR><LF>

where 'spdtau' is the new time constant that falls within the range of 0.0 to 200.1 seconds

The setting of this value depends upon the expected dynamics of the receiver. If the receiver will be in a highly dynamic environment, you should set this to a lower value, since the filtering window will be shorter, resulting in a more responsive measurement. However, if the receiver will be in a largely static environment, you can increase this value to reduce measurement noise.

Query the current setting:

$JATT,SPDTAU<CR><LF>

Receiver Response:

$>

Additional Information:

You can use the following formula to determine the COG time constant (Hemisphere GNSS recommends testing how the revised value works in practice):

\[ \text{spdtau (in seconds)} = \frac{10}{\text{maximum acceleration (in m/s²)}} \]

If you are unsure about the best value for this setting, it is best to be conservative and leave it at the default setting of 0.00 seconds.

Topic Last Updated: v1.06 / March 10, 2015
JATT,SUMMARY Command

Command Type:
Vector

Description:
Display a summary of the current Vector settings.

Command Format:
$JATT,SUMMARY$\langle\text{CR}\rangle\langle\text{LF}\rangle$

Receiver Response:
$>\text{JATT,SUMMARY},\text{htau},\text{hrtau},\text{ptau},\text{cogtau},\text{spdtau},\text{hbias},\text{pbias},\text{hexflag}\text{<CR>}\langle\text{LF}\rangle$

where:

<table>
<thead>
<tr>
<th>Component</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>htau</td>
<td>Current heading time constant, in seconds</td>
</tr>
<tr>
<td>hrtau</td>
<td>Current heading rate time constant, in seconds</td>
</tr>

</tr>
<tr>
<td>hexflag</td>
<td>Hex code that summarizes the heading feature status</td>
</tr>
</tbody>
</table>

Flag | 'On' | 'Off' |
Value | Value |
Gyro aiding 02 0  
Negative tilt 01 0  
Roll 08 0  
Tilt aiding 02 0  
Level 01 0

The 'hexflag' field is two separate hex flags:

- 'GN' - Value is determined by computing the sum of the gyro aiding and negative tilt values, depending on whether they are on or off:
  - If the feature is on, their value is included in the sum
  - If the feature is off, it has a value of zero when computing the sum
- 'RTML' - Value is determined in much the same way, but by adding the value of roll, tilt aiding, and level operation

For example, if gyro aiding, roll, and tilt aiding features were each on, the values of 'GN' and 'RTML' would be:
- 'GN' = hex (02 + 0) = hex (02) = 2
- 'RMTL' = hex (08 + 02) = hex (10) = A
- 'GN-RMTL' = 2A

The following tables summarize the possible feature configurations for the first 'GN' character and the second 'RMTL' character.

**JATT,SUMMARY 1st GN Character Configurations**

Additional Information:

Topic Last Updated: v.1. 06/ March 10, 2015
JATT,TILTAID Command

Command Type:
Vector

Description:
Turn tilt aiding on or off or query the current setting.

The Vector’s internal tilt sensors (accelerometers) may be enabled by default (see your specific product manuals for further information).

The sensors act to reduce the RTK search volume, which improves heading startup and reacquisition times. This improves the reliability and accuracy of selecting the correct heading solution by eliminating other possible, erroneous solutions.

Command Format:
Turn tilt aiding on/off

Turn tilt aiding on:
$JATT,TILTAID,YES<CR><LF>

Turn tilt aiding off:
$JATT,TILTAID,NO<CR><LF>

Query the current setting:
$JATT,TILTAID<CR><LF>

Receiver Response:

Response to issuing command to turn tilt aiding on/off:
$>

Response to querying the current setting:
If setting is currently ON the response is:
$>JATT,TILTAID,ON

If setting is currently OFF the response is:
$>JATT,TILTAID,OFF

Additional Information:
Tilt aiding is required to increase the antenna separation of the Vector OEM beyond the default 0.5 m length.

Topic Last Updated: v.1. 06/ March 10, 2015
JATT,TILTCAL Command

Command Type:

Vector

Description:

Calibrate the internal tilt sensors of the Vector Calibration takes approximately two seconds and is automatically saved to memory for subsequent power cycles.

You can calibrate the tilt sensor of the Vector in the field but the Vector enclosure must be horizontal when you calibrate.

$JATT,TILTCAL<CR><LF>

Command Format:

Receiver Response:

$>

Additional Information:

Topic Last Updated: v1.06 / March 10, 2015
JBAUD Command

Command Type:
General Operation and Configuration

Description:
Specify the baud rates of the receiver or query the current setting.

Command Format:
Specify the baud rates:
$JBAUD,r[,OTHER][,SAVE]<CR><LF>
where:
- 'r' = baud rate (4800, 9600, 19200, 38400, 57600, or 115200)
- 'OTHER' = optional field, enacts a change on the current port when you send the command without it (and without the brackets) and enacts a change on the other port when you send the command with it (without the brackets)
- 'SAVE' = optional field, saves the baud rate into flash memory so that if you reset power the receiver will boot at the new baud rate (it may take several seconds to save the baud rate to flash memory)

Query the current setting:
$JBAUD[,OTHER]<CR><LF>
where:
- 'OTHER' = optional field, queries the current port when you send the command without it (and without the brackets) and queries the other port when you send the command with it (without the brackets)

Receiver Response:
$>JBAUD,R[,OTHER]
The response format is the same whether you specify the baud rates or query the current settings.

Example:
Issue the following command to set the baud rate to 19200 on the current port:
$JBAUD,19200<CR><LF>
...the response is then:
$>JBAUD,19200
Issue the following command to set the baud rate to 9600 on the OTHER port and save it into memory:
$JBAUD,9600,OTHER,SAVE<CR><LF>
...the response is then:
$>JBAUD,9600,OTHER
Additional Information:

**Note:** When saving the baud rate wait until you see the SAVE COMPLETE message before powering off the receiver. See the `JSAVE` command for an example of this output.

The status of this command is also output when issuing the `JSHOW` command.

Topic Last Updated: v1.02 / January 25, 2011
**JBIN Command**

**Command Type:**
General Operation and Configuration

**Description:**
Enable the output of the various binary messages

**Command Format:**
$JBIN,msg,r<CR><LF>$

Where:
- 'msg' = binary message you want to output
- 'r' = message rate as shown in the following table

</table>

**Receiver Response:**

$>

**Example:**

To output the Bin76 message at a rate of 10 Hz, issue the following command:

$JBIN,76,10<CR><LF>

**Additional Information:**

Higher update rates may be available on select binary message.

**Topic Last Updated:** v3.0 / December 30, 2019
JBOOT Commands

JBOOT Command

Command Type:
General Operation and Configuration

Description:
Power cycles the receiver.

Command Format:

$JBOOT<CR><LF>

Receiver Response:

The response is similar to the following:

$>STARTED,MFA,Ver=5.9 Aa08

If any application other than MFA is the current application and you send the $JBOOT command, the response is similar to the following:

$>

Additional Information:

Topic Last Updated: v3.0 / December 30, 2019
JCONN Command

Command Type:
General Operation and Configuration

Description:
Create a virtual circuit between two ports to enable communication through the receiver to the device on the opposite port.

Command Format:
To connect two ports virtually:

$JCONN,P1,P2<CR><LF>

where P1 and P2 are a pair of the following: A,B,C,D or PortA,PortB,PortC,PortD

Examples:
$JCONN,A,B<CR><LF>
$JCONN,PortA,PortB<CR><LF>

To disconnect virtual connection:

$JCONN,X<CR><LF>

Receiver Response:

$

Additional Information:

Caution: Hemisphere GNSS receivers with menus, such as an R Series, use JCONN within the menu application. Any settings you make with JCONN on these products may disable the menu functions until power is cycled.

Topic Last Updated: v1.06 / March 10, 2015
## JDIFF Commands

### JDIFF Command

**Command Type:**
General Operation and Configuration

**Description:**
Specify or query the differential source of the receiver.

Forces the system to use “diff” as the source (see table in Command Format section below).

**Command Format:**
Specify the differential mode:

```
$JDIFF,diff[],SAVE]<CR><LF>
```

Where:
- ‘diff (differential source) may be one of the following:

<table>
<thead>
<tr>
<th>DIFF</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>OTHER</td>
<td>Instruct the receiver to use external corrections input through the opposite port that is communicating</td>
</tr>
<tr>
<td>THIS</td>
<td>Instruct the receiver to use external corrections input through the same port that is communicating</td>
</tr>
<tr>
<td>PORTA</td>
<td>Instruct the receiver to:</td>
</tr>
<tr>
<td></td>
<td>• Use external corrections input through the specified port.</td>
</tr>
<tr>
<td>or</td>
<td>• Allow RTCM2 (DGPS) inputs to receiver.</td>
</tr>
<tr>
<td>PORTB</td>
<td>Instruct the receiver to:</td>
</tr>
<tr>
<td>or</td>
<td>• Use external corrections input through the specified port.</td>
</tr>
<tr>
<td>PORTC</td>
<td>Instruct the receiver to:</td>
</tr>
<tr>
<td>or</td>
<td>• Allow RTCM2 (DGPS) inputs to receiver.</td>
</tr>
<tr>
<td>PORTD</td>
<td>Instruct the receiver to:</td>
</tr>
<tr>
<td></td>
<td>• Use external corrections input through the specified port.</td>
</tr>
<tr>
<td>BEACON</td>
<td>Instruct the receiver to use RTCM corrections entering Port C at a fixed rate of 9600 baud. This input does not have to be from a beacon receiver, such as SBX. However, this is a common source of corrections.</td>
</tr>
<tr>
<td>WAAS</td>
<td>Instruct the receiver to use SBAS. This is also the response when running the local dif application as the base.</td>
</tr>
<tr>
<td>RTK</td>
<td>Response when running the local dif or rover RTK application for the rover.</td>
</tr>
<tr>
<td>LBAND</td>
<td>Instruct the receiver to turn on the Atlas module and useAtlas. Setting diff to anything other than Atlas turns off the Atlas module.</td>
</tr>
</tbody>
</table>
Instruct the receiver to use e-Dif mode.

- NONE: Instruct the receiver to operate in autonomous mode. This turns off the use of SBAS, Atlas, and RTCM2 (DGPS); however, RTK is still allowed.

'SAVE' = optional field, saves the differential source into flash memory so that if you reset power the receiver will boot with the new differential source (it may take several seconds to save the differential source to flash memory).

Using $JDIFF with SBAS, RTCM2, or Atlas assigns the priority in the MFA. For example, RTCM2 is a higher priority if the assigned diff port is PORTA. See MFA for more information.

Query the current DIFF setting:

$JDIFF<CR><LF>

Receiver Response:

Receiver response when specifying the differential source:

$>

Receiver response when querying the differential source:

$>JDIFF,SOURCE,TYPEx

where:

- 'SOURCE' is the port/source as issued with the JDIFF command
- 'TYPE' is the differential type actually being used
- 'AUTO' is the response when queried in e-Dif

Example:

Issue the following command to query the receiver:

$JDIFF<CR><LF>

...and if the differential source is WAAS, the response is:

$>JDIFF,WAAS

Additional Information:

The status of this command is also output in the JSHOW message.

Topic Last Updated: v1.07/ February 16, 2017
JDIFF,AVAILABLE Command

Command Type:
General Operation and Configuration

Description:
Query the receiver for the differential types currently being received

Command Format:
$JDIFF,AVAILABLE<CR><LF>

Receiver Response:
$JDIFFX,AVAILABLE,x[,x][,x]...[,x]

where 'x' is the differential type(s)

Example:

Additional Information:

Topic Last Updated: v1.04 / May 29, 2012
JDIFFX,EXCLUDE Command

Command Type:
General Operation and Configuration

Description:
Specify the differential sources to be excluded from operating in a multi-differential application or query the receiver for excluded differential sources.

Command Format:
Specify the differential sources to be excluded:

Query the current setting:

$JDIFFX,EXCLUDE<CR><LF>

Receiver Response:
Response to issuing command to exclude differential sources
$>

Response to querying the current setting:

$JDIFFX,EXCLUDE[,SOURCE1][,SOURCE2]...[,SOURCEEn]<CR><LF>

where SOURCE1 through SOURCEEn represent each excluded source

Example:
Issue the following command to exclude RTCM3:

$JDIFFX,EXCLUDE,RTCM3<CR><LF>

If you then issue $JDIFFX,EXCLUDE<CR><LF> to query the current setting the response is (if RTCM3 is the only excluded source):

$>JDIFFX,EXCLUDE,RTCM3<CR><LF>

Additional Information:

Topic Last Updated: v1.10 / June 1, 2018
JDIFFX,GNSSOUT Command

Command Type:
General Operation and Configuration

Description:
Specify the GNSS systems to be output in the differential or query the current setting

Command Format:
Specify the GNSS systems to be output in the differential:

$JDIFFX,GNSSOUT,gnss,x<CR><LF>

where:
- ‘gnss’ = GNSS system to be output in the differential (GPS, GLONASS, BEIDOU, GALILEO)
- ‘x’ = NO (do not output specified GNSS system in the differential) or YES (output specified GNSS system in the differential)

Query the current setting

Query what GNSS systems are output in the differential:

$JDIFFX,GNSSOUT<CR><LF>

Query if a specific GNSS system is output in the differential:

$JDIFFX,GNSSOUT,gnss<CR><LF>

where ‘gnss’ is the GNSS system

Receiver Response:
Receiver response when specifying the GNSS systems to be output in the differential.

$>

Receiver response when querying the current setting, see Example section below:

Example:
Specify that GPS is output in correction formats:

$JDIFFX,GNSSOUT,GPS,YES<CR><LF>

Receiver Response:

$>

Query what GNSS systems are output in the differential:

$JDIFFX,GNSSOUT<CR><LF>

Response if just GPS:

$>JDIFFX,GNSSOUT,GPS

Response if all GPS and GLONASS:

$>JDIFFX,GNSSOUT,GPS,GLONASS

Query if a specific GNSS system is output in the differential (example uses GLONASS)
$JDIFFX,GNSSOUT,GLONASS<CR><LF>

Response if GLONASS is output:

$>JDIFFX,GNSSOUT,GLONASS,YES

Response if GLONASS is not output:

$>JDIFFX,GNSSOUT,GLONASS,NO

Additional Information:

Topic Last Updated: v1.07 / February 16, 2017
JDIFFX,INCLUDE Command

Command Type:
General Operation and Configuration

Description:
Specify the differential sources to be allowed to operate in a multi-differential application or query the receiver for included differential sources.

Command Format:
Specify the differential sources to be included:

Query the current setting

$JDIFFX,INCLUDE<CR><LF>

Receiver Response:
Response to issuing command to include differential sources:

$>

Response to querying the current setting:

$JDIFFX,INCLUDE[,SOURCE1][,SOURCE2]...[,SOURCEn]<CR><LF>
where SOURCE1 through SOURCEn represent each included source

Example:
Issue the following command to include CMR:

$JDIFFX,INCLUDE,CMR<CR><LF>

If you then issue $JDIFFX,INCLUDE<CR><LF> to query the current setting the response may be (showing all included sources including CMR):

$>JDIFFX,INCLUDE,SBAS,RTCM2,EDIF,DFX,CMR,RTCM3,ROX

Additional Information:
For example, if an Eclipse II receiver with SBAS,Atlas, and RTK-base in the same application (multi-diff) has no active Atlas subscription:

1. The receiver tries Atlas high precision services and when it is not found, falls back to Atlas DGPS service.
2. The receiver tries Atlas DGPS service and when it is not found, falls back to WAAS.
3. No warnings when subscription has expired – user expects a certain level of accuracy with Atlas services, not SBAS level accuracy.

If you do not actively watch the Atlas service end date, you could potentially use SBAS without knowing it. This command limits the differential sources to ensure a certain level of accuracy is retained.

Topic Last Updated: v1.10 / June 1, 2018
JDIFFX,SOURCE Command

Command Type:
General Operation and Configuration

Description:
Query the receiver for the differential source

Command Format:
$JDIFFX,SOURCE<CR><LF>

Receiver Response:
$>JDIFFX,source

where 'source' is the differential source

Example:
Response if Atlas is the differential source:
$>JDIFFX,SOURCE,LBAND

Response if RTK is the differential source through Port B:
$>JDIFFX,SOURCE,PORTB

Additional Information:

Topic Last Updated: v1.02 / January 25, 2011
JDIFFX,TYPE Command

Command Type:
General Operation and Configuration

Description:
Query the receiver for the differential type

Command Format:
$JDIFFX,TYPE<CR><LF>

Receiver Response:
$>JDIFFX,TYPE,type

where 'type' is one of the following differential types:

- NONE (no differential corrections)
- CMR
- DFX
- EDIF
- ROX
- RTCM2
- RTCM3
- SBAS

Example:

Response if SBAS is the differential type:
$>JDIFFX,TYPE,SBAS

Response if RTK (ROX) is the differential type:
$>JDIFFX,TYPE,ROX

Additional Information:

Topic Last Updated: v1.04 / May 29, 2012
**JDISNAVMODE Command**

**Command Type:**

General Operation and Configuration

**Description:**

Enable/disable Athena nav mode reporting in BIN1 and BIN3 messages.

**Command Format:**

$JDISNAVMODE<CR><LF>

**Receiver Response:**

Response to issuing command to enable/disable detailed nav mode display:

$>

Response to querying the current setting:

$> JDISNAVMODE[,DEFAULT][,PHOENIX]

**Additional Information:**

This setting is automatically saved and can be reset to default by sending $RESET

Topic Last Updated: v1.08 / June 21, 2017
JEPHOUT, PERIODSEC Command

Command Type:
General Operation and Configuration

Description:
To allow ephemeris messages (95, 65, 35) to go out a rate other than when they change. This also does the same rate for the ionoutc message 94. This is a global message and applies to all ephemeris messages on all ports.

Command Format:
Enable/disable the command
To enable this command
$JEPHOUT,1<CR><LF>
To disable this command:
$JEPHOUT,0<CR><LF>
Query the current setting:
$JEPHOUT<CR><LF>
Receiver Response:
Response to issuing command to enable/disable command
$>
Response to querying the current setting
If setting is currently enabled the response is:
$>JEPHOUT,1
If setting is currently disabled the response is:
$>JEPHOUT,0

Additional Information:

Topic Last Updated: v1.07 / October 13, 2016
JETHERNET Commands

JETHERNET Command Overview

The JETHERNET command is used to configure Ethernet settings on Ethernet-capable boards.

<table>
<thead>
<tr>
<th>Command</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>JETHERNET</td>
<td>Query current Ethernet configuration state</td>
</tr>
<tr>
<td>JETHERNET,MODE</td>
<td>Enable/Disable Ethernet and set IP address configuration</td>
</tr>
<tr>
<td>JETHERNET,PORTI</td>
<td>Enable/Disable PORTI virtual serial port</td>
</tr>
<tr>
<td>JETHERNET,NTRIPCLIENT</td>
<td>Configure receiving RTK corrections over IP from an NTRIP caster</td>
</tr>
<tr>
<td>JETHERNET,NTRIPSERVER</td>
<td>Configure sending RTK connections over IP to an NTRIP caster</td>
</tr>
<tr>
<td>JETHERNET,WEBUI</td>
<td>Enable/Disable the WebUI interface over HTTP</td>
</tr>
</tbody>
</table>

Topic Last Updated: v4.0 / June 30, 2019
JETHERNET,MODE

Command Type:
General Operation and Configuration

Description:
On receivers with Ethernet support, this command allows configuring how the receiver connects to a network on the Ethernet interface.

Command Format:
$JETHERNET,MODE,OFF<CR><LF>
$JETHERNET,MODE,DHCP<CR><LF>
$JETHERNET,MODE,STATIC,IP,SUBNET[,GATEWAY[,DNS]]<CR><LF>

Where IP, SUBNET, GATEWAY, and DNS are the ip address, subnet mask, gateway ip, and dns server ip respectively, in the standard decimal notation.

Receiver Response:
$>JETHERNET,MODE,...<CR><LF>

Example:
To disable Ethernet support, one would use the command.

$JETHERNET,MODE,OFF<CR><LF>

To enable Ethernet support in DHCP (automatic IP address assignment by the network) mode, use the following command:

$JETHERNET,MODE,DHCP<CR><LF>

To enable Ethernet support with a fixed IP address of 192.168.1.5, use the following command:

$JETHERNET,MODE,STATIC,192.168.1.5,255.255.255.0<CR><LF>

Additional Information:

Topic Last Updated v.1.07 / : February 16, 2017
JETHERNET, PORTI

Command Type:

General Operation and Configuration

Description:

This command configures the virtual serial port ‘PORTI’, which may be accessible via the Ethernet interface. By default PORTI is disabled, but may be enabled on a specified TCP port using this command. This interface supports acting as either TCP server or TCP client, depending on whether you specify a destination host or not. Messages can be enabled on the port with commands such as $JASC and $JBIN by specifying ‘PORTI’ as the destination port.

Note that PORTI provides full access just as a local serial port would, and does not have an authentication mechanism. As such, care should be taken for what networks it is enabled on, especially if behaving as a TCP server.

Command Format:

$JETHERNET, PORTI, OFF<CR><LF>

To turn off the PORTI interface.

$JETHERNET, PORTI, PORT<CR><LF>

Where ‘PORT’ is replaced with a port number to listen for incoming TCP connections on, behaving as a TCP server.

$JETHERNET, PORTI, HOST, PORT<CR><LF>

Where ‘HOST’ and ‘PORT’ are replaced with the host (IP address or domain name) and port to make an outgoing TCP connection to, behaving as a TCP client.

$JETHERNET, PORTI, HOST1, PORT1, HOST2, PORT2<CR><LF>

Same as the above, except allowing two host/port pairs. The second one is can be switched to if an outgoing connection to the first fails, or vice versa. Only one connection will be active at a time.

Receiver Response:

$>JETHERNET,PORTI,...<CR><LF>

Where the response reflects the current configuration.

Example:

To disable the PORTI virtual serial port, one may use the command:

$>JETHERNET,PORTI,OFF<CR><LF>

To enable PORTI listening on TCP port 5000, one may use the following command:

$>JETHERNET,PORTI,5000<CR><LF>

Additional Information:

Topic Last Updated: v3.0 / December 30, 2019
$JETHERNET,PORTUDP Command

Command Type:
General Operation and Configuration

Description:
The $JETHERNET,PORTUDP command allows configuring a virtual serial port for transmitting messages via UDP packets. Up to four destination host/port pairs may be specified, and messages will be sent to all of them at once. This is for outgoing data only, and incoming data or commands via UDP are not accepted. Messages can be enabled on the port with commands such as $JASC and $JBIN by specifying ‘PORTJ’ as the destination port.

Command Format:

$JETHERNET,PORTUDP,OFF<CR><LF>
To turn off the PORTJ transmission.

$JETHERNET,PORTUDP,HOST,PORT<CR><LF>
Where ‘HOST’ and ‘PORT’ are replaced with the host (IP address or domain name) and port to transmit UDP messages to.

$JETHERNET,PORTUDP,HOST1,PORT1,HOST2,PORT2,…<CR><LF>
Up to four hosts/port pairs may be specified.

Receiver Response:

$>JETHERNET,PORTUDP,...<CR><LF>
Where the response reflects the current configuration.

Topic Last Updated: v3/0/December 30, 2019
$JETHERNET,NTRIPCLIENT Command

Command Type:

General Operation and Configuration

Description:

The $JETHERNET,NTRIPCLIENT command allows configuring a simple NTRIP client for the receive correction messages from.

Command Format:

$JETHERNET,NTRIPCLIENT,OFF<CR><LF>

To turn off the NTRIP client transmission.

$JETHERNET,NTRIPCLIENT,HOST,PORT,MOUNTPOINT,USERNAME,PASSWORD<CR><LF>

Where ‘HOST’, ‘PORT’, ‘MOUNTPOINT’, ‘USERNAME’, and ‘PASSWORD’ are all replaced with the relevant configuration parameters for connecting to the NTRIP caster. The username and password fields can be omitted if the NTRIP caster in question does not require authentication.

Receiver Response:

$>JETHERNET,NTRIPCLIENT,...<CR><LF>

$>JETHERNET,NTRIPSTATUS,Connecting,0.0KB,0.0 seconds<CR><LF>

Where the first line indicates the current configuration, and the second line indicates the status of the NTRIP client connection. The second line will be omitted if the NTRIP client is turned off.

Topic Last Updated: v3.0/December 30, 2019
$JETHERNET,NTRIPSERVER Command

Description:

The $JETHERNET,NTRIPSERVER command allows configuring a simple NTRIP server for allowing sending correction messages to an NTRIP caster.

Command Type:

General Operation and Configuration

Command Format:

$JETHERNET,NTRIPSERVER,OFF<CR><LF>

To turn off the NTRIP server.

$JETHERNET,NTRIPSERVER,HOST,PORT,MOUNTPOINT,CORRTYPE,PASSWORD<CR><LF>

Where ‘HOST’, ‘PORT’, ‘MOUNTPOINT’, and ‘PASSWORD’ are all replaced with the relevant configuration parameters for connecting to the NTRIP caster. The ‘CORRTYPE’ field represents the correction type to send to the caster, and may be set to any of ROX, RTCM3, RTCM23, and CMR.

Query the current setting:

$JETHERNET,NTRIPSERVER <CR><LF>

Receiver Response:

$>JETHERNET,NTRIPSERVER,...<CR><LF>

$>JETHERNET,NTRIPSTATUS,Connecting,0.0KB,0.0 seconds<CR><LF>

Where the first line indicates the current configuration, and the second line indicates the status of the NTRIP server connection. The second line will be omitted if the NTRIP server is turned off.

Topic Last Updated: v4.0/June 30, 2020
$JETHERNET,WEBUI Command

Description:
The $JETHERNET,WEBUI command enables/disables the WebUI interface over HTTP.

Command Type:
General Operation and Configuration

Command Format:
$JETHERNET,WEBUI,ON<CR><LF>
To enable the WebUI interface.

$JETHERNET,WEBUI,OFF<CR><LF>
To disable the WebUI interface.

Query the current setting:
$JETHERNET,WEBUI<CR><LF>

Receiver Response:
$JETHERNET,WEBUI,...<CR><LF>
The response reflects whether the WebUI interface is enabled or disabled.

Topic Last Updated: v4/0/June 30, 2020
## JFLASH Commands

### JFLASH Command Overview

The JFLASH command is used to perform file operations via a USB flash drive on Eclipse and Eclipse II based receivers.

<table>
<thead>
<tr>
<th>Command</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>JFLASH,DIR</td>
<td>Display the files on a USB flash drive</td>
</tr>
<tr>
<td>JFLASH,FILE,CLOSE</td>
<td>Close an open file on a USB flash drive</td>
</tr>
<tr>
<td>JFLASH,FILE,NAME</td>
<td>Open a specific file, append to a specific file, or display the file name of the open file on a USB flash drive</td>
</tr>
<tr>
<td>JFLASH,FILE,OPEN</td>
<td>Create and open a file with an automatically generated file name on a USB flash drive</td>
</tr>
<tr>
<td>JFLASH,FREESPACE</td>
<td>Display the free space in kilobytes (KB) on a USB flash drive</td>
</tr>
<tr>
<td>JFLASH,NOTIFY,CONNECT</td>
<td>Enable/disable the automatic response when a USB flash drive is inserted or removed</td>
</tr>
<tr>
<td>JFLASH,QUERYCONNECT</td>
<td>Manually verify if a USB flash drive is connected or disconnected</td>
</tr>
</tbody>
</table>

**Topic Last Updated:** v1.02 / January 25, 2011
JFLASH,DIR Command

Command Type:
General Operation and Configuration

Description:
Display the files on a USB flash drive

You can only display files at the root level of the flash drive (you cannot navigate into subdirectories).

Command Format:
$JFLASH,DIR<CR><LF>

Receiver Response:
$>JFLASH,file1
$>JFLASH,file2
$>JFLASH,file3
$>JFLASH,filen

One line appears for each file at the root level of the flash drive.

Example:
If you issue the $JFLASH,DIR command and the root level of the flash drive contains the following files:
  hemi_1.bin, hemi_2.bin, hemi_3.bin the response is:
$>JFLASH,hemi_1.bin
$>JFLASH,hemi_2.bin
$>JFLASH,hemi_3.bin

Additional Information:

Topic Last Updated: v1.02 / January 25, 2011
**JFLASH,FILE,CLOSE Command**

**Command Type:**
General Operation and Configuration

**Description:**
Close an open file on a USB flash drive

Closing a file does not turn off the messages being written to the flash drive; it just closes the file so you can safely remove the flash drive. **Caution:** Close the file before removing the flash drive. Failure to do so may corrupt the file.

**Command Format:**

\$JFLASH,FILE,CLOSE<CR><LF>

**Receiver Response:**

\$>JFLASH,CLOSE mass_storage:0:filename

**Example:**

If you issue the \$JFLASH,FILE,CLOSE command and the ‘hemi_4.bin’ file on the flash drive is currently open, the response is:

\$>JFLASH,CLOSE mass_storage:0:HEMI_4.BIN

**Additional Information:**

Topic Last Updated: v1.02 / January 25, 2011
JFLASH,FILE,NAME Command

Command Type:
General Operation and Configuration

Description:
Open a specific file, append to a specific file, or display the file name of the open file on a USB flash drive

Command Format:
Open a specific file (overwrite or append):

$JFLASH,FILE,NAME,filename[,APPEND]<CR><LF>

where:

- 'filename' is the name of the file and it must be a legal 8.3 file name
- ',APPEND' is an optional field that allows you to append data to the file

Warning: Using this command without the ',Append' option overwrites the existing file without warning.

Display the name of the open file:

$JFLASH,FILE,NAME<CR><LF>

Receiver Response:

Response from issuing command to open an existing file or append to an existing file:

$>JFLASH, OPEN mass_storage:0:ilename

Response from issuing command to display the name of the open file

$>JFLASH, mass_storage:0:ilename

If you attempt to display the name of the open file and no file is actually open the response is:

$>JFLASH, NO FILE OPEN

Example:

If you issue the following command to open file hemi_4.bin on a USB flash drive:

$JFLASH,FILE,NAME,hemi_4.bin<CR><LF>

the response is:

$>JFLASH, mass_storage:0:\HEMI_4.BIN

Additional Information:

Topic Last Updated: v1.02 / January 25, 2011
JFLASH,FILE,OPEN Command

Command Type:
General Operation and Configuration

Description:
Create and open a file with an automatically generated file name (hemi_1.bin... hemi_99.bin) on a USB flash drive (only 8.3 file format is allowed)

Command Format:

$JFLASH,FILE,OPEN<CR><LF>

Receiver Response:

$>JFLASH,OPEN mass_storage:0:\filename

where 'filename' is the name of the new file

Example:

If you issue the $JFLASH,FILE,OPEN command and the root level of the flash drive contains the following files:
hemi_1.bin, hemi_2.bin, hemi_3.bin the response is:

$>JFLASH,OPEN mass_storage:0:\HEMI_4.bin

Additional Information:

Topic Last Updated: v1.02 / January 25, 2011
JFLASH,FREESPACE Command

Command Type:
General Operation and Configuration

Description:
Display the free space in kilobytes (KB) on a USB flash drive. You can use a flash drive larger than 4GB; however, this command will not display a number greater than 4GB.

Command Format:
$JFLASH,FREESPACE<CR><LF>

Receiver Response:
$>JFLASH,FREESPACE, numbytes bytes
where 'numbytes' is the number of kilobytes

Example:
The following response indicates a USB flash drive with approximately 2GB of free space.

$>JFLASH,FREESPACE,2001731584bytes

Additional Information:
Topic Last Updated: v1.02 / January 25, 2011
JFLASH,NOTIFY,CONNECT Command

Command Type:
General Operation and Configuration

Description:
Enable/disable the automatic response when a USB flash drive is inserted or removed (if port is not specified the response will be sent to the port that issued the command)

Command Format:
$JFLASH,NOTIFY,CONNECT,r,[PORT]<CR><LF>

Where:
- 'r' is the message status variable (0 = Off, 1 = On)
- '[PORT]' is an optional field you use to specify the port to which the response will be sent (if you do not specify a port, the response is sent to the port from which you issued the command)

Receiver Response:

Response to issuing command to enable notification:
$>

Response to inserting a flash drive if notification is enabled:
$>JFLASH,CONNECTED

Response to removing a flash drive if notification is enabled:
$>JFLASH,DISCONNECTED

Additional Information:
JFLASH,QUERYCONNECT Command

Command Type:
General Operation and Configuration

Description:
Manually verify if a USB flash drive is connected or disconnected

Command Format:
$JFLASH,QUERYCONNECT<CR><LF>

Receiver Response:
Response to verifying the connection status of a flash drive if the flash drive is connected:
$>JFLASH,CONNECTED
$

Response to verifying the connection status of a flash drive if the flash drive is disconnected:
$>JFLASH,DISCONNECTED
$

Additional Information:
Topic Last Updated: v1.02 / January 25, 2011
JFREQ Command

Command Type:
Atlas

Description:
Tune the Atlas receiver (manually or automatically) or query the receiver for the current setting.

Command Format:

Tune the Atlas receiver

To manually tune the receiver:

$JFREQ,freq,symb<CR><LF>

where:

1. 'freq' is the frequency in kHz (reply is in MHz)
2. symb' is the symbol baud rate (600)

Note:

Examples:

Correct: $JFREQ,1545915,600 (1,545,915 Hz,)

To auto-tune the receiver:

$JFREQ,0<CR><LF>

Note:

Query the current setting:

$JFREQ<CR><LF>

Receiver Response:

Response to issuing command to tune receiver:

$>
Response to querying the current setting:

$>JLBEAM,Sent sfreq,Used ufreq,Baud baud,Geolon[,AUTO]

where:

<table>
<thead>
<tr>
<th>Response Component</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>sfreq</td>
<td>Frequency to which the Atlas receiver is instructed to tune (in this example, 1557.8550 MHz)</td>
</tr>
<tr>
<td>ufreq</td>
<td>Frequency to which the Atlas receiver is tuned</td>
</tr>
<tr>
<td>baud</td>
<td>Baud rate of the signals being received</td>
</tr>
<tr>
<td>lon</td>
<td>Approximate longitude of the geostationary satellite to which the Atlas receiver is tuned</td>
</tr>
</tbody>
</table>

Example:

Manually Tune a Frequency (command and response):

$JFREQ,1545915,600

$>

Auto-Tune a Frequency based on Geographic Location (command and response):

$JFREQ,AUTO

$>

Query a Manually Tuned Receiver (response):

$>JLBEAM,Sent 1557.8350,Used 1557.8350,Baud 1200,Geo -101

Query an Auto-Tuned Receiver (response):

$>JLBEAM,Sent 1557.8550,Used 1557.8550,Baud 1200,Geo -101,AUTO

Additional Information:

The status of this command is also output when issuing the $SHOW command.

The following table provides frequency information for the Atlas satellites. This information is subject to change. Visit your Atlas service provider’s website for up-to-date satellite constellation and broadcast information.

<table>
<thead>
<tr>
<th>Coverage Area</th>
<th>Frequency</th>
<th>Baud Rate</th>
<th>Satellite Name</th>
</tr>
</thead>
<tbody>
<tr>
<td>North and South America</td>
<td>1545.915 MHz</td>
<td>600</td>
<td>AMERICAS</td>
</tr>
<tr>
<td>Asia-Pacific</td>
<td>1545.855 MHz</td>
<td>600</td>
<td>APAC</td>
</tr>
<tr>
<td>Europe, Middle East and Africa</td>
<td>1545.905 MHz</td>

<td>EMEA</td>
</tr>
<tr>
<td>Eastern Europe and Middle East</td>
<td>1545.915 MHz</td>
<td>600</td>
<td>MEAS</td>
</tr>
</tbody>
</table>
JGEO Command

Command Type:
SBAS

Description:
Display information related to the current frequency of SBAS or Atlas satellite and its location in relation to the receiver's antenna

Command Format:
$JGEO[,ALL]<CR><LF>

where ',ALL' is an optional field that displays information for all SBAS satellites (including those not being used)

Receiver Response:
$>JGEO,SENT=1575.4200,USED=1575.4200,PRN=prn,LON=lon,EL=ele,AZ=az

where:

<table>
<thead>
<tr>
<th>Response Component</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>JGEO</td>
<td>Message header</td>
</tr>
<tr>
<td>Sent=1575.4200</td>
<td>Frequency sent to the digital signal processor</td>
</tr>
<tr>
<td>Used=1575.4200</td>
<td>Frequency currently used by the digital signal processor</td>
</tr>
<tr>
<td>PRN=prn</td>
<td>WAAS satellite PRN number</td>
</tr>
<tr>
<td>Lon=lon</td>
<td>Longitude of the satellite</td>
</tr>
<tr>
<td>El=ele</td>
<td>Elevation angle from the receiver antenna to the WAAS satellite, reference to the horizon</td>
</tr>
<tr>
<td>AZ=az</td>
<td>Azimuth from the receiver antenna to the WAAS satellite, reference to the horizon</td>
</tr>
</tbody>
</table>

Example:
To display information related to the current frequency of SBAS issue the following command:

$JGEO[,ALL]<CR><LF>

The response is then:

$>JGEO,SENT=1575.4200,USED=1575.4200,PRN=122,LON=-54,EL=9.7,AZ=114.0

To display information for dual SBAS satellites issue the following command:

$JGEO[,ALL]<CR><LF>

The response is:

$>JGEO,SENT=1575.4200,USED=1575.4200,PRN=122,LON=-54,EL=9.7,AZ=114.0

$>JGEO,SENT=1575.4200,USED=1575.4200,PRN=134,LON=178,EL=5.0,AZ=252.6

The first line of output is identical to the output from the first JGEO query above; however, the second line of output provides information on the WAAS satellite not being currently used. Both lines of output follow the same format.
JHTYPE_SHOW Command

Queries the hardware type.
JI Command

JI Command

Command Type:
General Operation and Configuration

Description:
Display receiver information, such as its serial number and firmware version

Command Format:
$JI<CR><LF>

Receiver Response:
$>JI,SN,FLT,HW,PROD,SDATE,EDATE,SW,DSP<CR><LF>

where:

<table>
<thead>
<tr>
<th>Response Component</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>SN</td>
<td>Serial number of the GPS engine</td>
</tr>
<tr>
<td>FLT</td>
<td>Fleet number</td>
</tr>
<tr>
<td>HW</td>
<td>Hardware version</td>
</tr>
<tr>
<td>PROD</td>
<td>Production date code</td>
</tr>
<tr>
<td>SDATE</td>
<td>Subscription begin date</td>
</tr>
<tr>
<td>EDATE</td>
<td>Subscription expiration date</td>
</tr>
<tr>
<td>SW</td>
<td>Application software version number</td>
</tr>
<tr>
<td>DSP</td>
<td>DSP version (only valid for Atlas applications)</td>
</tr>
</tbody>
</table>

Example:
$>JI,19422368,20,1,04062018,01/01/1900,01/01/6455,5.9Aa08,89

Additional Information:

Topic Last Updated: v3.0/ December 30, 2019
JK Command

Command Type:
General Operation and Configuration

Description:
Subscribe the receiver to various options, such as higher update rates, Atlas or RTK.

or

Query for the current subscription expiration date when running Atlas application or the receiver subscription code when running all other applications

Command Format:

Subscribe the receiver to specific options:

$JK,x…<CR><LF>

where ‘x…’ is the subscription key provided by Hemisphere GNSS and is 56 characters in length

Query the current setting:

$JK<CR><LF>

Receiver Response:

Response to issuing command to subscribe:

$>

Response to querying the current setting:

$>JK,DateCode,SubscriptionCode,DowngradeCode

where:

- ‘DateCode’ indicates your subscription information (compare last four digits of Date Code to determine your subscription and see the Example section below and the examples in Understanding Additive Codes)
- ‘SubscriptionCode’ is the hex equivalent of the Date Code
- ‘DowngradeCode’ is the output rate in Hertz indicating a downgrade from the default of 10 Hz (if 1, 2 or 5 does not appear the output rate is the default 10 Hz)

Example:

If you query the receiver for the current setting when running Atlas applications the response will appear similar to the following:
$>JK,06/30/2011,0

If you query the receiver for the current setting when running any other application the response will appear similar to the following (Crescent Vector example response shown). Example shows no downgrade code (using default output rate of 10 Hz).

$>JK,01/01/3007,7

Additional Information:

Interpreting the $JK 'Date'/Subscription Codes

Last Updated: v.3.0/ December 30, 2019
JK SHOW Command

Command Type:
General Operation and Configuration

Description:
Contain authorization information

Command Format:
$JK,SHOW<CR><LF>

Receiver Response:
$>JK,SHOW,0,0,0,OPT=',SUBSCRIPTION DESCRIPTION,<CR><LF>

where:

Example:
$>JK,SHOW,0,157F,12/31/2016,0,OPT=',20HZ,EDIF,RTK,BASE,RAW_DATA,L2_L5,MULTI_GNSS,BEIDOU83,ATLAS_LBAND,ATLAS_30cm

Additional Information:

Interpreting the $JK 'Date'/Subscription Codes

Topic Last Updated: v3.0 / February 3, 2020
JLBEAM Command

Command Type:
L-Band

Description:
Display the information of each spot beam currently in use by the Atlas receiver

Command Format:
$JLBEAM<CR><LF>

Receiver Response:
$>JLBEAM,Sent 1545.9150,Used 1545.9150,Baud 600,Geo -98,AUTO
$>JLBEAM,Sent freq,Used freq,Baud xxx,Geo xxx (1)
$>JLBEAM,freq1,lon1,lat1,baud1,satlon1 (2).
$>JLBEAM,freqn,lonn,latn,baudn,satlonn

where:

<table>
<thead>
<tr>
<th>Response Component</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>&quot;Sent&quot; freq</td>
<td>Frequency sent to the digital signal processor (DSP)</td>
</tr>
<tr>
<td>&quot;Used&quot; freq</td>
<td>Frequency currently being used by the digital signal processor (DSP)</td>
</tr>
<tr>
<td>&quot;Baud&quot; xxx</td>
<td>Currently used baud rate of the acquired signal</td>
</tr>
<tr>
<td>&quot;Geo&quot; xxx</td>
<td>Currently used satellites longitude (in degrees)</td>
</tr>
</tbody>
</table>

The output second line components are described in the following table:

<table>
<thead>
<tr>
<th>Response Component</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>freq</td>
<td>Frequency of the spot beam</td>
</tr>
<tr>
<td>lon</td>
<td>Longitude of the center of the spot beam (in degrees)</td>
</tr>
<tr>
<td>lat</td>
<td>Latitude of the center of the spot beam (in degrees)</td>
</tr>
<tr>
<td>baud</td>
<td>Baud rate at which this spot beam is modulated</td>
</tr>
<tr>
<td>satlon</td>
<td>Satellites longitude (in degrees)</td>
</tr>
</tbody>
</table>

Example:

$>JLBEAM,Sent 1551.4890,Used 1551.4890,Baud 1200,Geo -101

$>JLBEAM,1556.8250,-88,45,1200,(-101)
$>JLBEAM,1554.4970,-98,45,1200,(-101)
$>JLBEAM,1551.4890,-108,45,1200,(-101)
$>JLBEAM,1531.2300,25,50,1200,(16)
$>JLBEAM,1535.1375,-75,0,1200,(-98)
$>JLBEAM,1535.1375,-165,13,1200,(-98)
$>JLBEAM,1535.1525,20,6,1200,(25)
$>JLBEAM,1558.5100,135,-30,1200,(160)
$>JLBEAM,1535.1375,90,15,1200,(109)
$>JLBEAM,1535.1375,179,15,1200,(109)

Additional Information:

Topic Last Updated: v3.0 / December 30, 2019
JLIMIT Command

Command Type:
General Operation and Configuration

Description:
Set the threshold of estimated horizontal performance for which the DGPS position LED is illuminated or query the current setting.

Command Format:
Set the threshold of estimated horizontal performance:

$JLIMIT, limit<CR><LF>

where 'limit' is the new limit in meters

Query the current setting:

$JLIMIT<CR><LF>

Receiver Response:
Receiver response when setting the threshold of estimated horizontal performance

$>

$>JLIM, RESID, LIMIT

where 'LIMIT' is the limit in meters

Example:
To set the threshold to 5 m issue the following command:

$JLIMIT, 5<CR><LF>

If you then query the receiver with $JLIMIT<CR><LF> the response is:

$JLIM, RESID, 5.00

Additional Information:
The default value for this parameter is a conservative 10.00 m. The status of this command is also output in the $JSHOW message.

Topic Last Updated: v1.02 / January 25, 2011
JLXBEAM Command

Command Type:

L-B

Description:
Display spot beam debug information.

Command Format:

$JLXBEAM<CR><LF>

Receiver Response:

$>JLBEAMEX

$> Beam:1,DDSfreq1,symbol1,lon1,lat1,lonrad1,latrad1,beamrot1,satlon1,*
$> Beam:2,DDSfreq2,symbol2,lon2,lat2,lonrad2,latrad2,beamrot2,satlon2,*
$> Beam:n,DDSfreqn,symboln,lonn,latn,lonradn,latradn,beamrot,n,satlonn,*

where:

<table>
<thead>
<tr>
<th>Response Component</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>DDSfreq</td>
<td>DDS frequency</td>
</tr>
<tr>
<td>symbol</td>
<td>Symbol rate used for that particular spot beam</td>
</tr>
<tr>
<td>lon</td>
<td>Longitude of the spot beam centroid</td>
</tr>
<tr>
<td>lat</td>
<td>Latitude of the spot beam centroid</td>
</tr>
<tr>
<td>lonrad</td>
<td>Longitude radius of the spot beam</td>
</tr>
<tr>
<td>latrad</td>
<td>Latitude radius of the spot beam</td>
</tr>
<tr>
<td>beamrot</td>
<td>Rotation angle of the spot beam</td>
</tr>
<tr>
<td>satlon</td>
<td>Longitude of the Atlas satellite</td>
</tr>
<tr>
<td>*</td>
<td>Reserved</td>
</tr>
</tbody>
</table>

Example:

$>JLBEAMEX

$> Beam:22,1535125000,600,-26,40,2,41,0,9999,*
$> Beam:21,1535157500,600,65,30,18,-21,64,*

$>$ Beam:24,1557835000,1200,-101,69,9,28,0,-101,*

$>$ Beam:24,1557835000,1200,-101,66,12,6,0,-101,*

$>$ Beam:25,1557845000,1200,-74,52,12,30,-30,-101,*

$>$ Beam:26,1557855000,1200,-122,45,11,30,25,-101,*

$>$ Beam:8,1535137500,1200,-85,2,30,20,-5,-98,*

$>$ Beam:8,1535137500,1200,-60,-25,34,36,-20,-98,*

$>$ Beam:4,1535137500,1200,109,2,14,19,-27,109,*

$>$ Beam:4,1535137500,1200,140,38,27,51,-56,109,*

$>$ Beam:7,1537440000,1200,23,-2,29,49,50,25,*

$>$ Beam:7,1537440000,1200,14,59,41,23,34,25,*

$>$ Beam:7,1537440000,1200,11,28,17,24,0,25,*
JMASK Command

Command Type:

GPS

Description:

Specify the elevation cutoff mask angle for the GPS engine

Any satellites below this mask angle will be ignored even if available. The default angle is 5° because satellites available below this angle will have significant tropospheric refraction errors.

Command Format:

$JMASK,e<CR><LF>

where the elevation mask cutoff angle 'e' may be a value from 0 to 60°

Receiver Response:

$>

Example:

To specify the elevation cutoff mask angle to 10° issue the following command:

$JMASK,10<CR><LF>

Additional Information:

To query the receiver for the current setting, issue the JSHOW command.

Topic Last Updated: v1.02 / January 25, 2011
JMODE Commands

Command Type:
General Operation and Configuration

Description:
Query receiver for status of JMODE settings

Command Format:
$JMODE<CR><LF>

Receiver Response:
$>JMODES[,BASE][,FIXLOC][,FOREST][,GLOFIX][,GPSONLY][,L1ONLY][,MIXED] [,NULLNMEA][,CMRPLUS]

Example:
If FOREST and TUNNEL are set to ON and all others (MIXED, NULLNMEA, SBASR, and TIMEKEEP) are set to OFF and you issue:

$JMODES,TUNNEL,FOREST

If all features are set to OFF and you issue the JMODE command the receiver response will be:

$JMODES

Additional Information:
The status of this command is also output in the JSHOW response. For example, if TUNNEL is set to ON and all other JMODE option:

$>JSHOW,Modes,TUNNEL

Topic Last Updated: v4.0 / June 30, 2020
**JMODE,BASE Command**

**Command Type:**

General Operation and Configuration, Local Differential and RTK Commands

**Description:**

Enable/disable base mode functionality or query the current setting:

- If base mode is NO (disabled) and the receiver is receiving RTK corrections, these corrections are echoed out when RTK corrections (ROX, RTCM3, CMR) are requested.
- If base mode is YES (enabled), the receiver computes its own corrections, regardless of whether or not it is receiving RTK corrections from another source.

**Command Format:**

Enable/disable base mode

To enable base mode:

$JMODE,BASE,YES<CR><LF>

To disable base mode:

$JMODE,BASE,NO<CR><LF>

Query the current setting:

$JMODE,BASE<CR><LF>

**Receiver Response:**

Response to issuing command to enable/disable base mode:

$>

Response to querying the current setting:

If base mode is currently enabled the response is:

$>JMODE,BASE,YES

If base mode is currently disabled the response is:

$>JMODE,BASE,NO

**Example:**

**Additional Information:**

Topic Last Updated: v1.04 / May 29, 2012
JMODE,BDSOFF Command

Command Type:
General Operation and Configuration

Description:
Set the receiver to use BDS data in the solution

Command Format:
Close/Open BDS operation

Close BDS operation:
$JMODE,BDSOFF,YES<CR><LF>

Open BDS operation:
$JMODE,BDSOFF,NO<CR><LF>

Receiver Response:
Response to issuing command to turn enable/disable BDS operation:
$>

Response to querying the current setting
If BDS operation is currently enabled the response is:
$>JMODE,BDSOFF,YES
If BDS operation is currently disabled the response is:
$>JMODE,BDSOFF,NO

Additional Information:

Topic Last Updated: v1.07 / October 13, 2016
$JMODE,CMRPLUS Command

Command Type:
General Operation and Configuration

Description:
Set the receiver to output CMR+ instead of CMR

Command Format: Output CMR+ instead of CMR

$JMODE,CMRPLUS,YES<CR><LF>
Output CMR instead of CMR+:

$JMODE,CMRPLUS,NO<CR><LF>

Receiver Response:
Response to issuing command to turn enable/disable CMR+ operation:

$>
Response to querying the current setting
If CMR+ is currently enabled the response is:

$>JMODE,CMRPLUS,YES
If CMR is currently disabled the response is:

$>JMODE,CMRPLUS,NO

Additional Information:

Topic Last Updated: v4.0/June 30, 2020
JMODE,FIXLOC Command

Command Type:
General Operation and Configuration

Description:
Set the receiver to not re-average (or re-average) its position or query the current setting.

$JMODE,FIXLOC,YES assure that the BASE will not re-average its position. Good for permanent installations.

Command Format:

Enable/disable position re-averaging

To set receiver to not re-average its position:

$JMODE,FIXLOC,YES<CR><LF>

To set receiver to re-average its position:

$JMODE,FIXLOC,NO<CR><LF>

Query the current setting:

$JMODE,FIXLOC<CR><LF>

Receiver Response:

Response to issuing command to enable/disable position re-averaging:

$>

Response to querying the current setting:

If setting is currently enabled (no position re-averaging) the response is:

$>JMODE,FIXLOC,YES

If setting is currently disabled (position re-averaging enabled) the response is:

$>JMODE,FIXLOC,NO

Example:

Additional Information:

Topic Last Updated: v1.04 / May 29, 2012
JMODE,FOREST Command

Command Type:
General Operation and Configuration

Description:
Enable/disable high gain functionality (for tracking under canopy) or query the current setting.

This command is useful if you are trying to maximize the likelihood of calculating a position, but are willing to sacrifice accuracy.

See also JMODE,MIXED.

Command Format:
Enable/disable high gain functionality
To enable high gain functionality:
$JMODE,FOREST,YES<CR><LF>
To disable high gain functionality:
$JMODE,FOREST,NO<CR><LF>
Query the current setting:
$JMODE,FOREST<CR><LF>

Receiver Response:

Response to issuing command to turn functionality on/off:
$>
Response to querying the current setting:
If high gain functionality is currently enabled the response is:
$>JMODE,FOREST,YES
If high gain functionality is currently disabled the response is:
$>JMODE,FOREST,NO

Additional Information:

Topic Last Updated: v1.02 / January 25, 2011
JMODE,GLOFIX

Command Type:

General Operation and Configuration

Description:

Enable/disable use of RTCM v3 (RTK) GLONASS correctors.

GLOFIX does not affect CMR or ROX (CMR does not have GLONASS, and ROX correctors are always used regardless of the GLOFIX setting) and SureTrack is automatically used for any satellite that does not have GLONASS correctors.

Command Format:

Enable/disable use of RTCM v3 GLONASS correctors
To enable use of RTCM v3 GLONASS correctors:

$JMODE,GLOFIX,YES<CR><LF>

To disable use of RTCM v3 GLONASS correctors:

$JMODE,GLOFIX,NO<CR><LF>

Query the current setting:

$JMODE,GLOFIX<CR><LF>

Receiver Response:

Response to issuing command to turn functionality on/off:

$>

Response to querying the current setting

If use of RTCM v3 GLONASS correctors is currently enabled the response is:

$>JMODE,GLOFIX,YES

If use of RTCM v3 GLONASS correctors is currently disabled the response is:

$>JMODE,GLOFIX,NO

Additional Information:

Topic Last Updated: v1.04 / May 29, 2012
JMODE,GLOOFF Command

Command Type:
General Operation and Configuration

Description:
Set the receiver to use GLONASS data in the solution

Command Format:
Close/Open GLONASS operation

Close GLONASS operation:
$JMODE,GLOOFF,YES<CR><LF>

Open GLONASS operation:
$JMODE,GLOOFF,NO<CR><LF>

Receiver Response:
Response to issuing command to turn enable/disable GLONASS operation
$>

Response to querying the current setting
If GLONASS operation is currently enabled the response is:
$>JMODE,GLOOFF,NO
If GLONASS operation is currently disabled the response is:
$>JMODE,GLOOFF,YES

Additional Information:
Topic Last Updated: v1.07 / October 13, 2016
JMODE,GPSOFF Command

Command Type:
General Operation and Configuration

Description:
Set the receiver to use GPS data in the solution or query the current setting

Command Format:
Close/Open GPS Operation
Close GPS operation:
$JMODE,GPSOFF,YES<CR><LF>
Open GPS operation:
$JMODE,GPSOFF,NO<CR><LF>

Receiver Response:
Response to issuing command to turn enable/disable GPS-only operation
$>
Response to querying the current setting
If GPS-only operation is currently enabled the response is:
$>JMODE,GPSONLY,YES
If GPS-only operation is currently disabled the response is:
$>JMODE,GPSONLY,NO

Additional Information:
Topic Last Updated: v1.07 / February 16, 2017
JMODE,GPSONLY Command

Command Type:
General Operation and Configuration

Description:
Set the receiver to use GPS data in the solution or query the current setting (if GLONASS is available, setting to YES will cause the receiver to only use GPS data)

Command Format:
<table>
<thead>
<tr>
<th>Enable/disable GPS-only operation</th>
</tr>
</thead>
<tbody>
<tr>
<td>Enable GPS-only operation:</td>
</tr>
<tr>
<td>$JMODE,GPSONLY,YES&lt;CR&gt;&lt;LF&gt;</td>
</tr>
<tr>
<td>Disable GPS-only operation (use GLONASS as well if available):</td>
</tr>
<tr>
<td>$JMODE,GPSONLY,NO&lt;CR&gt;&lt;LF&gt;</td>
</tr>
<tr>
<td>Query the current setting:</td>
</tr>
<tr>
<td>$JMODE,GPSONLY&lt;CR&gt;&lt;LF&gt;</td>
</tr>
</tbody>
</table>

Receiver Response:
| Response to issuing command to turn enable/disable GPS-only operation |
| $>                                      |
| Response to querying the current setting |
| If GPS-only operation is currently enabled the response is: |
| $>JMODE,GPSONLY,YES                        |
| If GPS-only operation is currently disabled the response is: |
| $>JMODE,GPSONLY,NO                          |

Additional Information:

Topic Last Updated: v1.02 / January 25, 2011
JMODE,L1ONLY Command

Command Type:
General Operation and Configuration

Description:
Set the receiver to use L1 data even if L2 data is available or query the current setting:

- When set to YES receiver will use Atlas DGPS service or L1 RTK
- When set to NO receiver will use Atlas high precision services or L1/L2 RTK

Command Format:
Set receiver to use/not use L1 data even if L2 data is available

To use L1 data (even if L2 data is available):
$JMODE,L1ONLY,YES<CR><LF>

To use L2 data if it is available:
$JMODE,L1ONLY,NO<CR><LF>

Query the current setting:
$JMODE,L1ONLY<CR><LF>

Receiver Response:

Response to issuing command to turn functionality on/off
$>

Response to querying the current setting
If the receiver is currently using L1 data only even if L2 data is available the response is:
$>JMODE,L1ONLY,YES

If the receiver is currently using L2 data if it is available the response is:
$>JMODE,L1ONLY,NO

Additional Information:

Topic Last Updated: v1.07 / February 16, 2017
JMODE,MIXED Command

Command Type:
General Operation and Configuration

Description:
Include satellites that do not have DGPS or SBAS corrections in the solution or query the current setting

This command is useful if you are trying to maximize the likelihood of calculating a position, but are willing to sacrifice accuracy. See also JMODE,FOREST.

Command Format:

To include/exclude satellites without DGPS or SBAS corrections
To include satellites without DGPS or SBAS corrections:

$JMODE,MIXED,YES<CR><LF>

To exclude satellites without DGPS or SBAS corrections:

$JMODE,MIXED,NO<CR><LF>

Query the current setting:

$JMODE,MIXED<CR><LF>

Receiver Response:
Response to issuing command to include/exclude satellites without DGPS or SBAS corrections
$>

Response to querying the current setting:
If satellites without differential corrections are currently included the response is:

$>JMODE,MIXED,YES

If satellites without differential corrections are currently excluded the response is:

$>JMODE,MIXED,NO

Additional Information:

Topic Last Updated: v1.04 / May 29, 2012
JMODE,NULLNMEA Command

Command Type:
General Operation and Configuration

Description:
Enable/disable output of NULL fields in NMEA 0183 messages when no there is no fix (when position is lost) or query the current setting

This only applies to position portion of the messages; it does not affect the time portion of the message. If this setting is disabled and position is lost then the positioning parameters of the message from the most recent known position are repeated (instead of being NULL if enabled).

Command Format:
Enable/disable output of NULL fields in NMEA 0183 messages

To enable output:
$JMODE,NULLNMEA,YES<CR><LF>

To disable output:
$JMODE,NULLNMEA,NO<CR><LF>

Query the current setting:
$JMODE,NULLNMEA<CR><LF>

Receiver Response:
Response to issuing command to enable/disable output of NULL fields in NMEA 0183 messages
$>

Response to querying the current setting

If setting is currently enabled the response is:
$>JMODE,NULLNMEA,YES

If setting is currently disabled the response is:
$>JMODE,NULLNMEA,NO

Example:
If the most recent GPGGA message is as follows:
$GPGGA,220715.00,3333.4254353,N,11153.3506065,W,2,10,1.0,406.614,M,-26.294,M,6.0,1001*70
...and then position is lost and JMODE,NULLNMEA is set to NO the GPGGA message repeats as follows (most recent known values do not change):
$GPGGA,220715.00,3333.4254353,N,11153.3506065,W,2,10,1.0,406.614,M,-26.294,M,6.0,1001*70

For the same message, if position is lost and JMODE,NULLNMEA is set to YES the GPGGA message repeats as follows (position parameters are NULL):
$GPGGA,220716.00,,,,0,,,,M,,M,,*48

Additional Information:

Topic Last Updated: v1.03 / January 11, 2012
JMODE,SBASNORTK Command

Command Type:
General Operation and Configuration

Description:
Disable/enable the use of SBAS ranging signals (carrier phase) in RTK

Command Format:
Disable/enable use of SBAS ranging signals in RTK
To disable use of SBAS ranging signals in RTK:
$JMODE,SBASNORTK,YES<CR><LF>
To enable use of SBAS ranging signals in RTK:
$JMODE,SBASNORTK,NO<CR><LF>
Query the current setting:
$JMODE,SBASNORTK<CR><LF>

Receiver Response:
Response to issuing command to disable/enable the use of SBAS ranging signals in RTK.
Response to issuing command to disable/enable the use of SBAS ranging signals in RTK

$>
Response to querying the current setting
If current setting is to disable SBAS ranging the response is:
$>JMODE,SBASNORTK,YES
If current setting is to enable SBAS ranging the response is:
$>JMODE,SBASNORTK,NO

Example:

Additional Information:

Topic Last Updated: v1.04 / May 29, 2012
JMODE,SBASR Command

Command Type:
General Operation and Configuration

Description:
Enable/disable SBAS ranging or query the current setting

Command Format:
Enable/disable SBAS ranging
To enable SBAS ranging:
$JMODE,SBASR,YES<CR><LF>
To disable SBAS ranging:
$JMODE,SBASR,NO<CR><LF>
Query the current setting:
$JMODE,SBASR<CR><LF>

Receiver Response:
Response to issuing command to enable/disable SBAS ranging
$>
Response to querying the current setting:
If setting is currently enabled the response is:
$>JMODE,SBASR,YES
If setting is currently disabled the response is:
$>JMODE,SBASR,NO

Additional Information:
Topic Last Updated: v1.04 / May 29, 2012
JMODE,STRICTRTK Command

Command Type:
General Operation and Configuration

Description:
Use this command to invoke stricter checks on whether RTK fix is declared. Forces float of RTK at 30 seconds of Age-of-Diff

Command Format:

Enable/disable STRICTRTK functionality

To enable STRICTRTK functionality:

$JMODE,STRICTRTK,YES<CR><LF>

To disable STRICTRTK functionality:

$JMODE,STRICTRTK,NO<CR><LF>

Query the current setting:

$JMODE,SURETRACK<CR><LF>

Receiver Response:

$>

Response to issuing command to enable/disable command

Response to querying the current setting:

If setting is currently enabled the response is:

$>JMODE,STRICTRTK,YES

If setting is currently disabled the response is:

$>JMODE,STRICTRTK,NO

Additional Information:
This mode is not saved between power cycles.
JMODE,SURETRACK Command

Command Type:
General Operation and Configuration

Description:
Enable/disable SureTrack functionality (default is enabled) or query the current setting

Command Format:
Enable/disable SureTrack functionality
To enable SureTrack functionality:
$JMODE,SURETRACK,YES<CR><LF>
To disable SureTrack functionality:
$JMODE,SURETRACK,NO<CR><LF>
Query the current setting:
$JMODE,SURETRACK<CR><LF>

Receiver Response:
Response to issuing command to enable/disable command:
$>
Response to querying the current setting:
If setting is currently enabled the response is:
$>JMODE,SURETRACK,YES
If setting is currently disabled the response is:
$>JMODE,SURETRACK,NO

Additional Information:
JMODE,SURVEY Command

Command Type:
General Operation and Configuration

Description:
Assure RTK fix is not declared when residual errors exceed 10 cm. Also forces use of GLONASS and prevents SureTrack operation.

Command Format:
Enable/disable continuous time updating
To enable this command
$JMODE,SURVEY,YES<CR><LF>
To disable this command:
$JMODE,SURVEY,NO<CR><LF>
Query the current setting:
$JMODE,SURVEY<CR><LF>
Response to issuing command to enable/disable command
Receiver Response:
$>
Response to querying the current setting
If setting is currently enabled the response is:
$>JMODE,SURVEY,YES
If setting is currently disabled the response is:
$>JMODE,SURVEY,NO

Additional Information:
This mode is not saved between power cycles (for now).

Topic Last Updated: v1.07 / October 13, 2016
JMODE,TIMEKEEP Command

Command Type:
General Operation and Configuration

Description:
Enable/disable continuous time updating in NMEA 0183 messages when there is no fix (when position is lost) or query the current setting.

When position is lost the time is the only parameter in the message that continues to update; all other parameters remain the same.

Command Format:

To enable continuous time updating:
$JMODE,TIMEKEEP,YES<CR><LF>

To disable continuous time updating:
$JMODE,TIMEKEEP,NO<CR><LF>

Query the current setting:
$JMODE,TIMEKEEP<CR><LF>

Receiver Response:

Response to issuing command to enable/disable continuous time updating
$>

Response to querying the current setting
If setting is currently enabled the response is:
$>JMODE,TIMEKEEP,YES

If setting is currently disabled the response is:
$>JMODE,TIMEKEEP,NO

Additional Information:

Topic Last Updated: v1.04 / May 29, 2012
JMODE,TUNNEL Command

Command Type:
General Operation and Configuration

Description:
Enable/disable faster reacquisition after coming out of a tunnel or query the current setting

Command Format:
Enable/disable faster reacquisition after coming out of a tunnel
To enable faster reacquisition:
$JMODE,TUNNEL,YES<CR><LF>
To disable faster reacquisition:
$JMODE,TUNNEL,NO<CR><LF>
Query the current setting:
$JMODE,TUNNEL<CR><LF>

Receiver Response:
Response to issuing command to turn functionality on/off
$>
Response to querying the current setting
If setting is currently enabled the response is:
$>JMODE,TUNNEL,YES
If setting is currently disabled the response is:
$>JMODE,TUNNEL,NO

Additional Information:

Topic Last Updated: v1.04 / May 29, 2012
JMSG99 Command

Command Type:
- Vector

Description:
Change the output in the Bin99 message to be from the specified antenna

Format:
- $JMSG99,0
  where '0' is used view the primary antenna SNR (default)
- $JMSG99,1
  where '1' is used view the secondary antenna SNR

Receiver Response:
- $>

Other:
Topic Last Updated: v1.06 / March 10, 2015
JNMEA

JNMEA,BDSOFFSET Command

Command Type
BeiDou

Description
Used to add an offset to the satellite id number for BeiDou GSV message

Command Format:
$JNMEA,BDSOFFSET,x
X='10, 100, 200

Examples:
The GBGSV message in its default form with no offset:
$GBGSV,2,1,08,21,09,249,,26,30,313,37,29,67,072,53,30,17,040,48,1*7E
$GBGSV,2,2,08,35,48,196,53,36,32,109,48,42,04,297,,45,74,032,53,1*77

The GBGSV message with $JNMEA,BDSOFFSET,100.
$GBGSV,2,1,08,121,09,249,,126,30,313,37,129,67,072,54,130,17,040,48,1*79
$GBGSV,2,2,08,135,48,196,53,136,32,109,48,142,04,297,,145,74,032,53,1*77

Receiver Response:
$>

Additional Information:

Topic Last Updated: v4.0/June 30, 2020
JNMEA,GGAALLGNSS Command

Command Type:

GLONASS

Description:

Configure the GGA string to include full GNSS information (the number of used GNSS satellites will be included in the GPGGA message) or query the current setting.

The GGA message is only supposed to report position and satellite information based on the GPS constellation. The combined constellation position and satellite data should be reported in the GNSS message, but some users with older equipment cannot utilize this message. This command allows users with older equipment that require a GGA message to be able to utilize and take advantage of the larger constellation of GNSS satellites.

Command Format:

<table>
<thead>
<tr>
<th>Include/exclude full GNSS information in GGA string</th>
</tr>
</thead>
<tbody>
<tr>
<td>To include full GNSS information in GGA string:</td>
</tr>
<tr>
<td>$JNMEA,GGAALLGNSS,YES&lt;CR&gt;&lt;LF&gt;</td>
</tr>
<tr>
<td>To exclude full GNSS information from GGA string:</td>
</tr>
<tr>
<td>$JNMEA,GGAALLGNSS,NO&lt;CR&gt;&lt;LF&gt;</td>
</tr>
<tr>
<td>Query the current setting:</td>
</tr>
<tr>
<td>$JNMEA,GGAALLGNSS&lt;CR&gt;&lt;LF&gt;</td>
</tr>
</tbody>
</table>

Receiver Response:

<table>
<thead>
<tr>
<th>Include/exclude full GNSS information in GGA string:</th>
</tr>
</thead>
<tbody>
<tr>
<td>$&gt;</td>
</tr>
<tr>
<td>Query the current setting:</td>
</tr>
<tr>
<td>If set to yes, querying the current setting returns the following:</td>
</tr>
<tr>
<td>$&gt;JNMEA,GGAALLGNSS,YES</td>
</tr>
<tr>
<td>If set to no, querying the current setting returns the following:</td>
</tr>
<tr>
<td>$&gt;JNMEA,GGAALLGNSS,NO</td>
</tr>
</tbody>
</table>

Additional Information:

Topic Last Updated: v1.07 February 16, 2017
$JNMEA,LIMITID,YES Command

Command Type:
General operation and configuration

Description:
Option to limit the range of the station ID field to be 0-1023 in GGA messages. Masks the base station ID by 0x3FF.

Command Format:
To enable the station ID limit:
$JNMEA,LIMITID,YES<CR><LF>

To disable the station ID limit:
$JNMEA,LIMITID,NO<CR><LF>

Query the current setting:
$JNMEA,LIMITID<CR><LF>

Receiver Response:
Response to issuing command to enable/disable station ID limit:
$>

Response to querying the current setting:
$>JNMEA,LIMITID,[YES/NO]

Example:

Additional Information:
By default, the station ID is not limited.

Atlas uses a Base ID of 4715, 4716, or 4717. This command will change the Base ID reported in the GGA message to 619, 620 or 621. This only affects the GGA message.

Topic Last Updated: v.4.0 / June 30, 2020
$JNMEA,PADHDG Command

Command Type:
General operation and configuration

Description:
Enable or disable zero-padding of digits before decimal for certain heading output messages. When enabled, this ensures that 3 digits will be printed before the decimal. Applies to the following messages:

3. HDT
4. HDG
5. HDM
6. HPR
7. THS
8. PASHR

Command Format:
To enable padding for heading:
$JNMEA,PADHDG,YES<CR><LF>

To disable padding for heading:
$JNMEA,PADHDG,NO<CR><LF>

Query the current setting:
$JNMEA,PADHDG<CR><LF>

Receiver Response:
Response to issuing command to enable/disable padding:
$>

Response to querying the current setting:
$>JNMEA,PADHDG,[YES/NO]

Example:
When padding is disabled, the HEHDT output message will display a heading of 22.5 degrees as:
$HEHDT,22.5,T*CC

When padding is enabled, the same heading would display as:
$HEHDT,022.5,T*CC

Additional Information:
Padding is disabled by default.

Topic Last Updated: v.3.0 / December 30, 2019
JNMEA,PRECISION Command

Command Type:
GPS, Local Differential and RTK, L-Band

Description:
Specify or query the number of decimal places to output in the GPGGA, GPGLL, and GPGNS messages or query the current setting.

Command Format:
Specify the number of decimal places
$JNMEA,PRECISION,x<CR><LF>
where 'x' specifies the number of decimal places from 1 to 8
Query the current setting:
$JNMEA,PRECISION<CR><LF>

Receiver Response:
Specify the precision:
$>
Query the current setting:
$>JNMEA,PRECISION,x
where 'x' refers to the number of decimal places to output

Additional Information:
When using RTK or Atlas high precision services, Hemisphere GNSS recommends you set JNMEA,PRECISION to at least 7 decimal places. High accuracy positioning techniques require at least 7 decimal places to maintain millimeter (mm) accuracy.

This command is the same as JNP.

Topic Last Updated: v1.07 / February 16, 2017
JNP Command

Command Type:
GPS, Local Differential and RTK, L-Band

Description:
Specify or query the number of decimal places to output in the GPGGA, GPGLL, and GPGLS messages or query the current setting

Command Format:
Specify the number of decimal places
$JNP,x<CR><LF>
where 'x' specifies the number of decimal places from 1 to 8

Query the current setting:
$JNP<CR><LF>

Receiver Response:
Specify the number of decimal places to output:
$>

Query the current setting:
$>JNP,x
where 'x' refers to the number of decimal places to output

Additional Information:
When using RTK or Atlas high precision services, Hemisphere GNSS recommends you set JNP to at least 7 decimal places. High accuracy positioning techniques require at least 7 decimal places to maintain millimeter (mm) accuracy.

This command is the same as JNMEA,PRECISION.

Topic Last Updated: v1.07 / February 16, 2017
JOFF Commands

Command Type:

GPS.

Description:

Turn off all data messages being output through the current port or other port (or Port C), including any binary messages such as Bin95 and Bin96

Command Format:

$JOFF[,OTHER]<CR><LF>

When you specify the ',OTHER' data field (without the brackets), this command turns off all messages on the other port. There are no variable data fields for this message.

You can issue this command as follows to turn off all messages on Port C:

$JOFF,PORTC<CR><LF>

Receiver Response:

$>

Additional Information:

Turn off all data messages being output through all ports, including any binary messages such as Bin95 and Bin96, see JOFF,ALL command

Topic Last Updated: v1.02 / January 25, 2011
JOFF,ALL Command

Command Type:
GPS

Description:
Turn off all data messages being output through all ports, including any binary messages such as Bin95 and Bin96

$JOFF,ALL<CR><LF>

Command Format:
Receiver Response:

$>

Additional Information:
To turn off all data messages being output through a single port, including any binary messages such as Bin95 and Bin96, see the JOFF command

Topic Last Updated: v1.02 / January 25, 2011
JOFF Command

Command Type:
GPS

Description:
Turn off all data messages being output through the current port or other port (or Port C), including any binary messages such as Bin95 and Bin96.

Command Format:
$JOFF[,OTHER]<CR><LF>

When you specify the ',OTHER' data field (without the brackets), this command turns off all messages on the other port. There are no variable data fields for this message.

You can issue this command as follows to turn off all messages on Port C:
$JOFF,PORTC<CR><LF>

Receiver Response:
>

Additional Information:
To turn off all data messages being output through all ports, including any binary messages such as Bin95 and Bin96, see the JOFF,ALL command.

Topic Last Updated: v1.02 / January 25, 2011
JPOS Command

Command Type:
General Operation and Configuration

Description:
Speed up the initial acquisition when changing continents with the receiver or query the receiver for the current position of the receiver (for example, powering up the receiver for the first time in Europe after it has been tested in Canada).

The command enables the receiver to begin the acquisition process for the closest SBAS spot beams. This saves some time with acquisition of the SBAS service. However, use of this message is typically not required because of the quick overall startup time of the receiver module.

Command Format:
Specify the latitude and longitude

$JPOS,lat,lon<CR><LF>

where both 'lat' and 'lon':

• Must be entered in decimal degrees
• Do not need to be more accurate than half a degree

Query the current setting

$JPOS<CR><LF>

Receiver Response:

Receiver response when specifying the latitude and longitude

$>

Receiver response when querying the current setting

$>JPOS,LAT,LON

Additional Information:

The status of this command is also output in the JSHOW message.

Topic Last Updated: v1.02 / January 25, 2011
JPPS Command

JPPS, WIDTH Command

Command Type:
General Operation and Configuration

Description:
Specify the pps width of the receiver or query the current setting

Command Format:
Set the receiver's specific pps width (microseconds)

$JPPS,WIDTH,r,SAVE<CR><LF>

where:
'r' = specific pps width. The SAVE field is optional. However, if omitted this setting will not survive a power cycle. This setting is not saved with $JSAVE. It must be saved by adding the SAVE field.

Query the current setting:

Response to issuing command:

$PPS,WIDTH<CR><LF>

Receiver Response:

Response to querying the current setting:

$JPPS,WIDTH,999.996<CR><LF>

Example:

Issue the following command to set the pps width to 2.000 on the current port:

$JPPS,WIDTH,2<CR><LF>

...the response is then:

$>

If you query the current setting now, the response is:

$JPPS,WIDTH,2.000<CR><LF>

Additional Information:

This mode is not saved between power cycles
JPPS, FREQ Command

Command Type:
General Operation and Configuration

Description:
Specify the pps frequency of the receiver or query the current setting.

Command Format:
Set the receiver's specific pps frequency (in Hz)

$JPPS,FREQ,r,SAVE<CR><LF>

where:
'r' = specific pps frequency

The SAVE field is optional. However, if omitted this setting will not survive a power cycle. This setting is not saved with $JSAVE. It must be saved by adding the SAVE field.

Query the current setting

Response to issuing command:

$PPS,FREQ<CR><LF>

Receiver Response:
$>

Response to querying the current setting:

$JPPS,FREQ,1.00<CR><LF>

Example:
Issue the following command to set the pps frequency to 2.000 on the current port:

$JPPS,FREQ,2<CR><LF>

...the response is then:

$>

If you query the current setting now, the response is:

$JPPS,FREQ,2.00<CR><LF>

Additional Information:
This mode is not saved between power cycles.

Topic Last Updated: v1.07 / October 13, 2016
**JPPS, PERIOD Command**

Command Type:
General Operation and Configuration

Description:
Specify the pps period (in seconds) of the receiver or query the current setting.

Command Format:
Set the receiver’s specific pps period

$JPPS,PERIOD,r<CR><LF>

where:
'\(r\)’ = specific pps period (inverse of frequency)

The SAVE field is optional. However, if omitted this setting will not survive a power cycle. This setting is not saved with $JSAVE. It must be saved by adding the SAVE field.

Query the current setting

Response to issuing command:

$>

$PPS,PERIOD<CR><LF>

Receiver Response:

Response to querying the current setting:

$JPPS,PERIOD,1.0<CR><LF>

Example:

Issue the following command to set the pps period to 2 seconds (0.5 Hz)

$JPPS,PERIOD,2<CR><LF>

...the response is then:

$>

If you query the current setting now, the response is:

$JPPS,PERIOD,2.000<CR><LF>

Additional Information:

This mode is not saved between power cycles

Topic Last Updated: v1.07 / October 13, 2016
JPRN,EXCLUDE Command

**JPRN,EXCLUDE Command**

**Note:** For advanced users only. Not required for typical operation.

**Command Type:**

General Operation and Configuration Commands

**Description:**

For advanced users only.

Exclude GPS and/or other GNSS satellites from being used in the positioning solution or query the current setting

**Command Format:**

Exclude PRNs from being used in the positioning solution

Exclude GPS and/or other GNSS PRNs:

$JPRN,EXCLUDE[,GPS,x,x,x...][,GLO,y,y,y...][,GAL,z,z,z...]<CR><LF>

Where:

- ‘x,x,x...’ represents the GPS PRNs you want to exclude
- ‘y,y,y...’ represents the GLONASS PRNs you want to exclude
- ‘z,z,z...’ represents the GALILEO PRNs you want to exclude

Exclude no GNSS PRNs:

$JPRN,EXCLUDE,NONE<CR><LF>

Exclude no GPS PRNs

$JPRN,EXCLUDE,GPS,NONE<CR><LF>

Exclude no GLONASS PRNs:

$JPRN,EXCLUDE,GLO,NONE<CR><LF>

Exclude no GALILEO PRNs:

$JPRN,EXCLUDE,GAL,NONE<CR><LF>

Query the current setting

Query all excluded PRNs (GPS and GLONASS):

$JPRN,EXCLUDE,<CR><LF>

Query excluded GPS PRNs:

$JPRN,EXCLUDE,GPS,<CR><LF>
Query excluded GLONASS PRNs:

$JPRN,EXCLUDE,GLO<CR><LF>

Query excluded GALILEO PRNs:

$JPRN,EXCLUDE,GAL<CR><LF>

Receiver Response:

See Example section below

Example:

If you excluded no GPS or GLONASS PRNs and issued the $JPRN,EXCLUDE,GPS<CR><LF> command the response is:

$>JPRN,EXCLUDE,GPS,NONE,GLO,NONE

If you excluded one GPS PRN (22) and one GLONASS PRN (10) and issued the following commands you would see the following corresponding responses:

- Command: $JPRN,EXCLUDE,GPS<CR><LF> Response: $>JPRN,EXCLUDE,GPS,22
- Command: $JPRN,EXCLUDE,GLO<CR><LF> Response: $>JPRN,EXCLUDE,GLO,10
- Command: $JPRN,EXCLUDE<CR><LF>

Response:

$>JPRN,EXCLUDE,GPS,22,GLO,10

Additional Information:

Topic Last Updated: v1.07 / February 16, 2017
$JPRN,IN/EXCLUDE,BDSPHASE3 Command

Command Type:
General operation and configuration

Description:
Enable or disable tracking of all Beidou Phase-3 satellites.

Command Format:
To include Beidou Phase-3:
$JPRN, INCLUDE, BDSPHASE3<CR><LF>

To exclude Beidou Phase-3:
$JPRN, EXCLUDE, BDSPHASE3<CR><LF>

Query the current setting:
$JPRN, BDSPHASE3<CR><LF>

Receiver Response:
Receiver response when in/excluding Beidou Phase-3:
$>

Receiver response when querying the current setting:
$>JPRN, [INCLUDE/EXCLUDE], BDSPHASE3

Example:

Additional Information:
This setting is automatically saved to non-volatile memory.

Topic Last Updated: v.3.0 / December 30, 2019
JQUERY Commands

JQUERY,GUIDE Command

Command Type:
General Operation and Configuration

Description:
Query the receiver for its determination on whether or not it is providing suitable accuracy after both the SBAS and GPS have been acquired (up to five minutes)

This feature takes into consideration the download status of the SBAS ionospheric map and also the carrier phase smoothing of the unit.

Command Format:
$JQUERY,GUIDE<CR><LF>

Receiver Response:
If the receiver is ready for use with navigation, or positioning with optimum performance, it returns:

$>JQUERY,GUIDE,YES<CR><LF>

Otherwise, it returns:

$>JQUERY,GUIDE,NO<CR><LF>

Additional Information:

Topic Last Updated: v1.00 / August 11, 2010
JQUERY,RTKPROG Command

Command Type:
Local Differential and RTK

Description:
Perform a one-time query of RTK fix progress information

Command Format:
$JQUERY,RTKPROG<CR><LF>
As an alternative you can log this as a message using the JASC,PSAT,RTKPROG command.

Receiver Response:
$>JQUERY,RTKPROG,R,F,N,SS1,SS2,SS3,MASK*CC<CR><LF>
where:

<table>
<thead>
<tr>
<th>Message Component</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>R</td>
<td>1 = Ready to enter RTK ambiguity fix</td>
</tr>
<tr>
<td></td>
<td>0 = Not ready to enter RTK ambiguity fix</td>
</tr>
<tr>
<td>F</td>
<td>1 = Receiver running in RTK ambiguity fix mode</td>
</tr>
<tr>
<td></td>
<td>0 = Receiver not running in RTK ambiguity fix mode</td>
</tr>
<tr>
<td>N</td>
<td>Number of satellites used to fix</td>

**JQUERY,RTKSTAT Command**

**Command Type:**
Local Differential and RTK

**Description:**
Perform a one-time query of the most relevant parameters affecting RTK

**Command Format:**

\[ $\texttt{JQUERY,RTKSTAT} <\texttt{CR}><\texttt{LF}> \]

As an alternative you can log this as a message using the $\texttt{JASC,PSAT,RTKSTAT}$ command.

**Receiver Response:**

\[ $\texttt{>JQUERY,RTKSTAT,MODE,TYP,AGE,SUBOPT,DIST,SYS,NUM,SNR,RSF,BSF,HAG,ACCSTAT,SNT} \]

where

<tr>
<td>ACCSTAT</td>
<td>RTK accuracy status (hex), where:</td>
</tr>
</tbody>
</table>

- 0x1 = no differential or differential too old, for the application
- 0x2 = problems with differential message
- 0x4 = horizontal position estimate poor for the application
- 0x8 = HDOP high, poor satellite geometry
- 0x10 = fewer than 6 L1 sats used
- 0x20 = poor L1 SNRs
- 0x40 = not in RTK mode
- 0x80 = not in RTK mode or RTK only recently solved (< 10secs ago)
- 0x100 = RTK solution compromised, may fail

The status message can be any of the above or any combination of the above. For example, a status message of '047' indicates the following:

- 0x1 = no differential or differential too old, for the application
- 0x2 = problems with differential message
- 0x4 = horizontal position estimate poor for the application
- 0x40 = not in RTK mode

JQUERY,TEMPERATURE Command

Command Type:

General Operation and Configuration

Description:

Query the receiver's temperature

Command Format:

$JQUERY,TEMPERATURE<CR><LF>

Receiver Response:

$>JQUERY,TEMPERATURE,51.88

Additional Information:

Topic Last Updated: v1.04 / May 29, 2012
JRAD Commands

JRAD Command Overview

This topic provides information related to the NMEA 0183 messages accepted by the receiver’s e-Dif application.

The following table provides a brief description of the commands supported by the e-Dif application for its control and operation.

<table>
<thead>
<tr>
<th>Command</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>JRAD,1</td>
<td>Display the current reference position in e-Dif applications only</td>
</tr>
<tr>
<td>JRAD,1,P</td>
<td>e-Dif: Record the current position as the reference with which to compute e-Dif corrections. This would be used in relative mode as no absolute point information is specified.</td>
</tr>
<tr>
<td>DGPS Base Station: Record the current position as the reference with which to compute Base Station corrections in e-Dif applications only. This would be used in relative mode as no absolute point information is specified.</td>
<td></td>
</tr>
<tr>
<td>JRAD,2</td>
<td>Forces the receiver to use the new reference point (you normally use this command following a JRAD,1 type command)</td>
</tr>
<tr>
<td>JRAD,3</td>
<td>Invoke the e-Dif function once the unit has started up with the e-Dif application active, or, update the e-Dif solution (calibration) using the current position as opposed to the reference position used by the JRAD,2 command</td>
</tr>
<tr>
<td>JRAD,7</td>
<td>Turn auto recalibration on or off</td>
</tr>
<tr>
<td>JRAD,9</td>
<td>Initialize the Base Station feature and use the previously entered point, either with $JRAD,1,P or $JRAD,1,LAT,LON,HEIGHT, as the reference with which to compute Base Station corrections in e-Dif applications only. Use this for both relative mode and absolute mode.</td>
</tr>
<tr>
<td>JRAD,10</td>
<td>Specify BDS message to be transmitted by base station</td>
</tr>
</tbody>
</table>

Note: Use the JSAVE command to save changes you need to keep and wait for the $>SAVE COMPLETE response.

Topic Last Updated: v1.07 / October 13, 2016
JRAD,1 Command

Command Type:
e-Dif, DGPS Base Station

Description:
Display the current reference position in e-Dif applications only

Command Format:
$JRAD,1<CR><LF>

Receiver Response:
$>JRAD,1,LAT,LON,HEIGHT

Where:

<table>
<thead>
<tr>
<th>Command Component</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>LAT</td>
<td>Latitude of the reference point in decimal degrees</td>
</tr>
<tr>
<td>LON</td>
<td>Longitude of the reference point in decimal degrees</td>
</tr>
<tr>
<td>HEIGHT</td>
<td>Ellipsoidal height of the reference point in meters</td>
</tr>
</tbody>
</table>

Upon startup of the receiver with the e-Dif application running—as opposed to with the SBAS application—no reference position will be present in memory. If you attempt to query for the reference position, the receiver’s response will be:

$>JRAD,1,FAILED,PRESENT LOCATION NOT STABLE

Example:

When you issue the $JRAD,1 command the response will be similar to the following:

$>JRAD,1,51.00233513,-114.08232345,1050.212

Additional Information:

Topic Last Updated: v1.02 / January 25, 2011
JRAD,1,LAT,LON,HEIGHT Command

Command Type:
Dif, DGPS Base Station

Description:
Use this command—a derivative of the JRAD,1,P command—when absolute positioning is required in e-Dif applications only

Command Format:
$JRAD,1,lat,lon,height<CR><LF>

Where:

<table>
<thead>
<tr>
<th>Command Component</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>lat</td>
<td>Latitude of the reference point in decimal degrees</td>
</tr>
<tr>
<td>lon</td>
<td>Longitude of the reference point in decimal degrees</td>
</tr>
<tr>
<td>height</td>
<td>Ellipsoidal height of the reference point in meters. Ellipsoidal height can be calculated by adding the altitude and the geoidal separation, both available from the GPGGA message.</td>
</tr>
</tbody>
</table>

Example:
$GPGGA,173309.00,5101.04028,N,11402.38289,W,2,07,1.4,1071.0,M,-17.8,M,6.0,0122*48

Ellipsoidal height = 1071.0 + (-17.8) = 1053.2 meters

Both latitude and longitude must be entered as decimal degrees. The receiver will not accept the command if there are no decimal places.

Receiver Response:
$>JRAD,LAT,LON,HEIGHT

Additional Information:

Topic Last Updated: v1.00 / August 11, 2010
JRAD,1,P Command

Command Type:

Dif, DGPS Base Station

Description:

e-Dif: Record the current position as the reference with which to compute e-Dif corrections. This would be used in relative mode as no absolute point information is specified.

DGPS Base Station:

Record the current position as the reference with which to compute Base Station corrections in e-Dif applications only. This would be used in relative mode as no absolute point information is specified.

Command Format:

$JRAD,1,P<CR><LF>

Receiver Response:

$>JRAD,1,OK

Additional Information:

Topic Last Updated: v1.00 / August 11, 2010
**JRAD,2 Command**

**Command Type:**

*e-Dif*

**Description:**

Forces the receiver to use the new reference point

You normally use this command following a [JRAD,1](#) type command.

**Command Format:**

$JRAD,2<CR><LF>

**Receiver Response:**

$>JRAD,2,OK

**Additional Information:**

Topic Last Updated: v1.00 / August 11, 2010
JRAD,3 Command

Command Type:
e-Dif

Description:
This command has two primary purposes.
To invoke the e-Dif function once the unit has started up with the e-Dif application active
To update the e-Dif solution (calibration) using the current position as opposed to the reference position used by the JRAD,2 command

Command Format:
$JRAD,3<CR><LF>

Receiver Response:
If the receiver has tracked enough satellites for a long enough period before you issue this command, it will respond with the following. (The tracking period can be from 3 to 10 minutes and is used for modeling errors going forward.)
$>JRAD,3,OK<CR><LF>
If the e-Dif algorithms do not find sufficient data, the receiver responds with:
$>JRAD,3,FAILED,NOT ENOUGH STABLE SATELLITE TRACKS

Additional Information:
If you receive the failure message after a few minutes of operation, try again shortly after until you receive the "OK" acknowledgement message. The e-Dif application begins operating as soon as the $>JRAD,3,OK message has been received; however, a you will still need to define a reference position for e-Dif unless relative positioning is sufficient for any needs.

Topic Last Updated: v1.00 / August 11, 2010
**JRAD,7 Command**

**Command Type:**
e-Dif
dif

**Description:**
Turn auto recalibration on or off

**Command Format:**
$JRAD,7,n

where 'n' is the auto-recalibration variable (0 = Off or 1 = On, 0 is the default)

**Receiver Response:**
$>JRAD,7,OK

**Additional Information:**

Topic Last Updated: v1.04 / May 29, 2012
JRAD,9 Command

Command Type:
DGPS Base Station

Description:
Initialize the Base Station feature and use the previously entered point, either with $JRAD,1,P or $JRAD,1 LAT,LON,HEIGHT, as the reference with which to compute Base Station corrections in e-Dif applications only. Use this for both relative mode and absolute mode.

Command Format:
To initialize/turn off base station mode
To initialize base station mode and use stored coordinates:
 JRAD,9,1,1<CR><LF>

To turn off base station mode:
$JRAD,9,0<CR><LF>

Receiver Response:
$>JRAD,9,OK
(same response for turning base station mode on or off)

Additional Information:
The $JASC,RTCM,1 command must be sent to the receiver to start outputting standard RTCM corrections.

Topic Last Updated: v1.04 / May 29, 2012
JRAD,10 Command

Command Type:
DGPS Base Station

Description:
Specify BDS message to be transmitted by base station

Command Format:
Specify BDS message to be transmitted by base station
$JRAD,10,1
Specify BDS message to be not transmitted by base station
$JRAD,10,0

Receiver Response:

$>JRAD,10,OK
(same response for specify BDS to be transmitted or not)

Additional Information:
Topic Last Updated: v1.07 / October 13, 2016
JRESET Command

Command Type:
General Operation and Configuration

Description:
Reset the receiver to its default operating parameters by:

- Turning off outputs on all ports
- Saving the configuration
- Setting the configuration to its defaults (in following table)

<table>
<thead>
<tr>
<th>Configuration</th>
<th>Setting</th>
</tr>
</thead>
<tbody>
<tr>
<td>Elev Mask</td>
<td>5</td>
</tr>
<tr>
<td>Residual limit</td>
<td>10</td>
</tr>
<tr>
<td>Alt aiding</td>
<td>None</td>
</tr>
<tr>
<td>Age of Diff</td>
<td>45 minutes</td>
</tr>
<tr>
<td>Air mode</td>
<td>Auto</td>
</tr>
<tr>
<td>Diff type</td>
<td>Default for app</td>
</tr>
<tr>
<td>NMEA precision</td>
<td>5 decimals</td>
</tr>
<tr>
<td>COG smoothing</td>
<td>None</td>
</tr>
<tr>
<td>speed smoothing</td>
<td>None</td>
</tr>
<tr>
<td>WAAS thresholds</td>
<td>UERE</td>
</tr>
</tbody>
</table>

Command Format:

$JRESET[x]<CR><LF>

Where 'x' is an optional field:

- When set to ALL does everything $JRESET does, plus it clears almanacs
- When set to BOOT does everything $JRESET,ALL does, plus clears use of the real-time clock at startup, clears use of backed-up ephemeris and almanacs, and reboots the receiver when done

Receiver Response:

$JRESET

$> Saving Configuration. Please Wait...
$> Save Complete

CAUTION: $JRESET clears all parameters. For the V101 Series and the LV101 you will have to issue the $JATT, FLIPBRD YES command to properly redefine the circuitry orientation inside the product once the receiver has reset. Failure to do so will cause radical heading behavior.

Additional Information:

Topic Last Updated: v1.00 / August 11, 2010
JRELAY Command

Command Type:
General Operation and Configuration

Description:
Send user-defined text out of a serial port

Command Format:
$JRELAY,PORTx,msg<CR><LF>

- ‘x’ = destination port where the message (MSG) will be sent
- ’msg’ = message to be sent

Receiver Response:
$>

Example 1:
Command:
$JRELAY,PORTA,HELLO\nTHERE\n<CR><LF>
Response:
HELLO THERE
$>

Example 2:
The following commands apply to the A101 and A325 antennas. You can configure the A101 and A325 through the serial ports using these commands.

Configure the setup and output of tilt commands as follows (note that all commands are preceded with $JRELAY,PORTC, to direct them through internal Port C):

$JRELAY,PORTC,$JTILT,CALIBRATE[,RESET]
Output the tilt offset values for the X and Y axes. If performing a reset, ensure the A101/A325 is on a flat surface.

$JRELAY,PORTC,$JTILT,TAU[,value]
Output the filter constant for tilt value smoothing.

$JRELAY,PORTC,$JTILT,COMPENSATION[,|ON|OFF],[heightoffset]]
Turn positioning tilt compensation on/off (currently only the GPGGA data log is supported for tilt compensated position output).

$JRELAY,PORTC,$JASC,GPGGA,rate[,port]
Turn tilt compensated GPGGA message on.

$JRELAY,PORTC,$JTILT,COGBIAS[,value]
Set a COG bias to be used in the tilt compensation algorithms (for use when the A101/A325 is not mounted with the connector facing the forward direction of travel).

$JRELAY,PORTC,$JASC,INTLT,rate[,port]

or

$JRELAY,PORTC,$JASC,PSAT,INTLT,rate[,port]

Log tilt information from the A101/A325

• Set/query the receiver mode—serial or NMEA2000(commands must be sent over Port A):

$JRELAY,PORTC,$QUERYMODE

Query the receiver for the current mode

$JRELAY,PORTC,$SERIALMODE

Set the receiver mode to serial

$JRELAY,PORTC,$N2KMODE

Set the receiver mode to NMEA2000

Additional Information:

Topic Last Updated: v1.02 / January 25, 2011
JRAIM Command

Command Type:
RAIM

Description:
Specify the parameters of the RAIM scheme that affect the output of the PSAT,GBS message or query the current setting

Command Format:
Specify the parameters of the RAIM scheme
$JRAIM,hpr,probhpr,probfalse<CR><LF>
where:

<table>
<thead>
<tr>
<th>Command Component</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>hpr</td>
<td>Horizontal Protection Radius: notification in the PSAT,GBS message that the horizontal error has exceeded this amount will be received. The acceptable range for this value is 1 to 10,000 m. The default is 10 m.</td>
</tr>
<tr>
<td>probhpr</td>
<td>Maximum allowed probability that the position computed lies outside the HPR. The acceptable range for this value is 0.001% to 50%. The default is 5%.</td>
</tr>
<tr>
<td>probfalse</td>
<td>Maximum allowed probability that there is a false alarm (that the position error is reported outside the of the HPR, but it is really within the HPR). The acceptable range for this value is 0.001% to 50%. The default is 1%.</td>
</tr>
</tbody>
</table>

Query the current setting
$JRAIM

Receiver Response:
Response to issuing command to specify RAIM scheme parameters
$>
Response to querying the current setting
$>JRAIM,HPR,probHPR,probFALSE

Example:
To specify the RAIM scheme parameters as HPR = 8 m, probHPR = 2%, and probFALSE= 0.5% issue the following command:
$JRAIM,8,2,0.5<CR><LF>
If you then query the receiver for the RAIM scheme issue the following command:
$JRAIM<CR><LF>
...and the response will be:
$>JRAIM,8.00,2.0000,0.5000
Additional Information:

The purpose of the probability of false alarm is to help make a decision on whether to declare a fault or warning in an uncertain situation. The philosophy is to only issue a fault if the user is certain (to within the probability of a false alarm) that the protection radius has been exceeded, else issue a warning.

Topic Last Updated: v1.02 / January 25, 2011
JRTCM3 Commands

JRTCM3,ANTNAME Command

Command Type:
Local Differential and RTK

Description:
Specify the antenna name that is transmitted in various RTCM3 messages from the base

Command Format:
Specify the antenna name

$JRTCM3,ANTNAME,name

where name must be an antenna name from the following list: http://www.ngs.noaa.gov/ANTCAL/LoadFile?file=ngs08.003

Query the current setting:

$JRTCM3,ANTNAME<CR><LF>

Receiver Response:
Response to issuing command to specify the antenna name

$>

Response to querying the current setting

$JRTCM3,ANTNAME,name

where name is the previously specified antenna name

Example:
To specify the antenna name as a Hemisphere GNSS A42 antenna (HEMA42), issue the following command:

$JRTCM3,ANTNAME,HEMA42<CR><LF>

If you then issue $JRTCM3,ANTNAME<CR><LF> to query the current setting the response is:

$>JRTCM3,ANTNAME,HEMA42<CR><LF>

Additional Information:
See JRTCM3,NULANT for information on setting the antenna name to a null value (no name)

Topic Last Updated: v1.06 / March 10, 2015
JRTCM3,EXCLUDE

Command Type:
Local Differential and RTK

Description:
Specify RTCM3 message types to not be transmitted (excluded) by base station

Command Format:
Specify the RTCM3 messages to not be transmitted

$JRTCM3,EXCLUDE[,1004],[1005],[1006],[1007],[1008],[1012],[1033],[1104],[4011],[MSM3],[MSM4]<CR><LF>

Query the current setting:

$JRTCM3,EXCLUDE<CR><LF>

Receiver Response:
Response to issuing command to excludes specific RTCM3 messages from being transmitted

$>

Response to querying the current setting:

$JRTCM3,EXCLUDE[,MSG1],[MSG2]...[,MSGn]<CR><LF>

where MSG1 through MSGn represent each included message type to not be transmitted (excluded)

Example:
Assume all available RTCM3 messages are included (1004, 1005, 1006, 1007, 1008, 1012, 1033). You then issue the following command to exclude message types 1004, 1006, and 1012:

$JRTCM3,EXCLUDE,1004,1006,1012<CR><LF>

If you then issue $JRTCM3,EXCLUDE<CR><LF> to query the current setting the response is:

$>JRTCM3,EXCLUDE,1004,1006,1012<CR><LF>

Correspondingly, if you issue $JRTCM3,INCLUDE<CR><LF> to query the current setting for included messages the response is:

$>JRTCM3,INCLUDE,1005,1007,1008,1033<CR><LF>

Additional Information:

See JRTCM3,INCLUDE for more information on including RTCM3 messages for transmission

Topic Last Updated: v1.07 / October 13, 2016
JRTCM3,INCLUDE Command

**Command Type:**
Local Differential and RTK

**Description:**
Specify RTCM3 message types to be transmitted by base station

**Command Format:**
Specify the RTCM3 messages to be transmitted

$JRTCM3,INCLUDE[,1004][,1005][,1006][,1007][,1008][,1012][,1033][,1104][,4011][,MSM3][,MSM4]<CR><LF>

Query the current setting

$JRTCM3,INCLUDE<CR><LF>

**Response:**
Response to issuing command to include specific RTCM3 messagesto be transmitted

$>

Response to querying the current setting:

$JRTCM3,INCLUDE[,MSG1][,MSG2]...[,MSGn]<CR><LF>

where MSG1 through MSGn represent each included message type to be transmitted

**Example:**
Assume none of the available RTCM3 messages are included (1004, 1005, 1006, 1007, 1008, 1012, 1033). You then issue the following command to include message types 1004, 1006, and 1012

$JRTCM3,INCLUDE,1004,1006,1012<CR><LF>

If you then issue $JRTCM3,INCLUDE<CR><LF> to query the current setting the response is:

$>JRTCM3,INCLUDE,1004,1006,1012<CR><LF>

**Additional Information:**
See JRTCM3,EXCLUDE for more information on including RTCM3 messages for transmission

Topic Last Updated: v1.07 / October 13, 2016
JRTCM3,NULANT Command

Command Type:
Local Differential and RTK

Description:
Specify the antenna name as null (no name) that is transmitted in various RTCM3 messages from the base

Command Format:
Specify the antenna name as null
$JRTCM3,NULLANT<CR><LF>

Response to issuing command to exclude specific RTCM3 messages from being transmitted

Receiver Response:
$>

Example:
Assume you previously specified the antennan ame as a Hemisphere GNSS A42 antenna (HEMA42). If you issue
$JRTCM3,ANTNAME<CR><LF>
to query the current setting the response is:
$>JRTCM3,ANTNAME,HEMA42<CR><LF>

Now send the following command to specify the antenna name as null (no name):
$>JRTCM3,NULLANT<CR><LF>

If you then issue $JRTCM3,ANTNAME<CR><LF> to query the current setting the response is:
$>JRTCM3,ANTNAME,<CR><LF>

Additional Information:
See JRTCM3,ANTNAME for information on specifying the antenna name as something other than null

Topic Last Updated: v1.06 / March 10, 2015
### JRTK Commands

#### JRTK Command Overview

The JRTK commands are used to define or query RTK settings.

<table>
<thead>
<tr>
<th>Command</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>JRTK,1</td>
<td>Show the receiver’s reference position (can issue command to base station or rover)</td>
</tr>
<tr>
<td>JRTK,1,LAT, LON, HEIGHT</td>
<td>Set the receiver’s reference position to the coordinates you enter (can issue command to base station or rover)</td>
</tr>
<tr>
<td>JRTK,1,P</td>
<td>Set the receiver’s reference coordinates to the current calculated position if you do not have known coordinates for your antenna location (can issue command to base station or rover)</td>
</tr>
<tr>
<td>JRTK,5</td>
<td>Show the base station’s transmission status for RTK applications (can issue command to base station)</td>
</tr>
<tr>
<td>JRTK,5,Transmit</td>
<td>Suspend or resume the transmission of RTK (can issue command to base station)</td>
</tr>
<tr>
<td>JRTK,6</td>
<td>Display the progress of the base station (can issue command to base station)</td>
</tr>
<tr>
<td>JRTK,12</td>
<td>Disable or enable the receiver to go into fixed integer mode (RTK) vs. float mode (L-Dif) - can issue command to rover</td>
</tr>
<tr>
<td>JRTK,17</td>
<td>Display the transmitted latitude, longitude, and height of the base station (can issue command to base station or rover)</td>
</tr>
<tr>
<td>JRTK,18</td>
<td>Display the distance from the rover to the base station, in meters (can issue command to rover)</td>
</tr>
<tr>
<td>JRTK,18,BEARING</td>
<td>Display the bearing from the base station to the rover, in degrees (can issue command to rover)</td>
</tr>
<tr>
<td>JRTK,18,NEU</td>
<td>Display the distance from the rover to the base station and the delta North, East, and Up, in meters (can issue command to rover)</td>
</tr>
<tr>
<td>JRTK,28</td>
<td>Set the base station ID transmitted in ROX/DFX/CMR/RTCM3 messages (can issue command to base station)</td>
</tr>
</tbody>
</table>

Topic Last Updated: v1.03 / January 11, 2012
JRTK,1 Command

Command Type:
Local Differential and RTK

Description:
Show the receiver’s reference position (can issue command to base station or rover)

Command Format:
$JRTK,1<CR><LF>

Receiver Response:
$JRTK,1,LAT,LON,HEIGHT

where:

<table>
<thead>
<tr>
<th>Command Component</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>LAT</td>
<td>Latitude of the reference point in decimal degrees</td>
</tr>
<tr>
<td>LON</td>
<td>Longitude of the reference point in decimal degrees</td>
</tr>
<tr>
<td>HEIGHT</td>
<td>You must enter HEIGHT as ellipsoidal height in meters. Ellipsoidal height can be calculated by adding the altitude and the geoidal separation, both available from the GPGGA message.</td>
</tr>
</tbody>
</table>

Example:
$GPGGA,173309.00,5101.04028,N,11402.38289,W,2,07,1.4,1071.0, M,- 17.8,M,6.0, 0122*48

ellipsoidal height = 1071.0 + (-17.8) = 1053.2 meters

Example:
$>JRTK,1,33.55679117,-111.88955483,374.600

Additional Information:

Topic Last Updated: v1.02 / January 25, 2011
JRTK,1,LAT,LON,HEIGHT Command

Command Type:
Local Differential and RTK

Description:
Set the receiver's reference position to the coordinates you enter (can issue command to base station or rover)

Command Format:
$JRTK,1,lat,lon,height<CR><LF>

where:

<table>
<thead>
<tr>
<th>Command Component</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>lat</td>
<td>Latitude of the reference point in decimal degrees</td>
</tr>
<tr>
<td>lon</td>
<td>Longitude of the reference point in decimal degrees</td>
</tr>
<tr>
<td>height</td>
<td>You must enter HEIGHT as ellipsoidal height in meters.</td>
</tr>
<tr>
<td></td>
<td>Ellipsoidal height can be calculated by adding the altitude and the geoidal separation, both available from the GPGGA message.</td>
</tr>
</tbody>
</table>

**Example:**

$GPGGA,173309.00,5101.04028,N,11402.38289,W,2,07,1.4,1071.0, M,- 17.8, M, 6.0, 0122*48

Ellipsoidal height = 1071.0 + (-17.8) = 1053.2 meters

Receiver Response:

$>

Additional Information:
Topic Last Updated: v1.02 / January 25, 2011
JRTK,1,P Command

Command Type:
Local Differential and RTK

Description:
Set the receiver’s reference coordinates to the current calculated position if you do not have known coordinates for your antenna location (can issue command to base station or rover)

$JRTK,1,P<\text{CR}><\text{LF}>

Command Format:

Receiver Response:

$>

Additional Information:
If you have known coordinates for your antenna location, use the JRTK,1,LAT,LON,HEIGHT command to enter the latitude and longitude (in decimal degrees) and the ellipsoidal height (in meters).

Topic Last Updated: v1.02 / January 25, 2011
JRTK,5 Command

Command Type:
Local Differential and RTK

Description:
Show the base station's transmission status for RTK applications (can issue command to base station)

Command Format:

$JRTK,5<CR><LF>

Receiver Response:

If transmission status is suspended, response is as follows:

$>JRTK,6

If transmission status is not suspended, response is as follows:

$>JRTK,5,1

Additional Information:

Also see the JRTK,6 command.

Topic Last Updated: v1.02 / January 25, 2011
JRTK,5,Transmit Command

Command Type:
Local Differential and RTK

Description:
Suspend or resume the transmission of RTK (can issue command to base station)

Command Format:
$JRTK,5,transmit<CR><LF>
where "transmit" is 0 (suspend) or 1 (resume)

Receiver Response:
If the transmission status is not suspended and you issue the following command to suspend:
$JRTK,5,0<CR><LF>
the response is as follows:
$>JRTK,5,OK

Similarly, if the transmission status is suspended and you issue the following command to resume:
$JRTK,5,1<CR><LF>
the response is again as follows:
$>JRTK,5,OK

Additional Information:
Topic Last Updated: v1.02 / January 25, 2011
JRTK,6 Command

Command Type:
Local Differential and RTK

Description:
Display the progress of the base station (can issue command to base station)

Command Format:
$JRTK,6<CR><LF>

Receiver Response:
$JRTK,6,TimeToGo,ReadyTransmit,Transmitting

Where:

<table>
<thead>
<tr>
<th>Response Component</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>TimeToGo</td>
<td>Seconds left until ready to transmit RTK</td>
</tr>
</tbody>
</table>

| ReadyTransmit | Non zero when configured to transmit and ready to transmit RTK on at least one port. It is a bit mask of the transmitting port, with bit 0 being port A, bit 1 being port B, and bit 2 being port C. It will be equal to "Transmitting" unless transmission has been suspended with $JRTK,5,0. |
| Transmitting | Non-zero when actually transmitting RTK on at least one port. It is a bit mask of the transmitting port, with bit 0 being port A, bit 1 being port B, and bit 2 being port C. |

Example:
If the receiver is not ready to transmit:

$>JRTK,6,263,0,0

If the receiver is currently transmitting on Port B:

$>JRTK,6,0,2,2

Additional Information:

Topic Last Updated: v1.02 / January 25, 2011
JRTK,12 Command

Warning! Hemisphere GNSS recommends that only advanced users employ this command.

Command Type:
Local Differential and RTK

Description:
Disable or enable the receiver to go into fixed integer mode (RTK) vs. float mode (L-Dif) - can issue command to rover

Note:
Requires RTK rover subscription

Command Format:
$JRTK,12,x

where 'x' is:
1 = Allow RTK (recommended, and the default)
0 = Do not allow RTK, stay in L-Dif

Receiver Response:
$>

Additional Information:

In high multipath conditions it may be desirable to prevent the rover from obtaining a fixed position. Using $JRTK,12,0 while logging position data is useful for determining the level of multipath present.

Topic Last Updated: v1.02 / January 25, 2011
JRTK,17 Command

Command Type:
Local Differential and RTK

Description:
Display the transmitted latitude, longitude, and height of the base station (can issue command to base station or rover)

Command Format:

$JRTK,17<CR><LF>

Receiver Response:

$>JRTK,17,lat,lon,height

Example:

$>JRTK,17,33.55709242,-111.88916894,380.534

Additional Information:

Format is similar to JRTK,1LAT,LON,HEIGHT

Topic Last Updated: v1.02 / January 25, 2011
JRTK,18 Command

Command Type:
Local Differential and RTK

Description:
Display the distance from the rover to the base station, in meters (can issue command to rover)

Command Format:
$JRTK,18<CR><LF>

Receiver Response:
$>JRTK,18,d

• ‘d’ is the baseline distance in meters
• ‘m’ indicates the units are meters

Example:
$>JRTK,18,13154.520

Additional Information:

Topic Last Updated: v1.03 / January 11, 2012
JRTK,18,BEARING Command

Command Type:
Local Differential and RTK

Description:
Display the bearing from the base station to the rover, in degrees (can issue command to rover)

Command Format:
$JRTK,18,BEARING<CR><LF>

Receiver Response:
$>JRTK,18,b

• 'b' is the bearing from base to rover in degrees
• 'd' indicates the units are degrees

Example:
$>JRTK,18,20.014

Additional Information:
Topic Last Updated: v1.03 / January 11, 2012
JRTK,18,NEU Command

Command Type:
Local Differential and RTK

Description:
Display the distance from the rover to the base station and the delta North, East, and Up, in meters can issue command to rover

Command Format:
$JRTK,18,NEU<CR><LF>

Receiver Response:
$>JRTK,18,d,X,Y,Z

where:
- ‘d’ is the baseline distance in meters
- ‘m’ indicates the units are meters
- ‘X’ is the North delta, in meters
- ‘Y’ is the East delta, in meters
- ‘Z’ is the Up delta, in meters

Example:
$>JRTK,18,13154.509,12360.045,4502.139,33.739

Additional Information:
Topic Last Updated: v1.03 / January 11, 2012
JRTK,28 Command

Command Type:
Local Differential and RTK

Description:
Set the base station ID transmitted in ROX/DFX/CMR/RTCM3 messages (can issue command to base station), where:

- Default is 333
- Range is 0-4095 (except for CMR which is 0-31)

Command Format:
Set the base station ID

$JRTK,28,baseid<CR><LF>

where 'baseid' is the base station ID

Query the current setting:

$JRTK,28<CR><LF>

Receiver Response:

$>

Example:

To set the base station ID to 123 issue the following command:

$JRTK,28,123<CR><LF>

If the base station ID is 333 and you issue the $JRTK,28<CR><LF>
query the response is:

$>JRTK,28,333

Additional Information:

Topic Last Updated: v1.02 / January 25, 2011
JSAVE Command

Command Type:
General Operation and Configuration

Description:
Send this command after making changes to the operating mode of the receiver

Command Format:
$JSAVE<CR><LF>

Receiver Response:
$> SAVING CONFIGURATION. PLEASE WAIT...
then
$> Save Complete

Additional Information:
Ensure that the receiver indicates that the save process is complete before turning the receiver off or changing the configuration further.

No data fields are required. The receiver indicates that the configuration is being saved and indicates when the save is complete.

Topic Last Updated: v1.00 / August 11, 2010
JSHOW Commands

JSHOW Command
Command Type:
General Operation and Configuration

Description:
Query the current operating configuration of the receiver

Command Format:
$JSHOW<CR><LF>

Receiver Response:
Use the JSHOW command to provide a complete response from the receiver.

Example (number in parentheses corresponds to line number in table following the response):

$>JSHOW,BAUD,9600 (1)
$>JSHOW,BAUD,9600,OTHER (2)
$>JSHOW,BAUD,9600,PORTC (3)
$>JSHOW,ASC,GPGGA,1.0,OTHER (4)
$>JSHOW,ASC,GPVTG,1.0,OTHER (5)
$>JSHOW,ASC,GPGSV,1.0,OTHER (6)
$>JSHOW,ASC,GPGST,1.0,OTHER (7)
$>JSHOW,ASC,D1,1,OTHER (8)
$>JSHOW,DIFF,WAAS (9)
$>JSHOW,ALT,NEVER (10)
$>JSHOW,LIMIT,10.0 (11)
$>JSHOW,MASK,5 (12)
$>JSHOW,POS,51.0,-114.0 (13)
$>JSHOW,AIR,AUTO,OFF (14)
$>JSHOW,FREQ,1575.4200,250 (15)
$>JSHOW,AGE,1800 (16)

Description of responses:

JSHOW,ASC Command

Command Type:
General Operation and Configuration

Description:
Query receiver for current ASCII messages being output

Command Format:
$JSHOW,ASC[,x]<CR><LF>

where x is one of the following:

- PORTA
- PORTB
- PORTC
- PORTD
- OTHER - displays

Whatever port you are connected to you do not need to specify that port. For example, if you connected to Port A, the following two commands result in the same response:

$JSHOW,ASC<CR><LF>
$JSHOW,ASC,PORTA<CR><LF>

Receiver Response:
See Example section below

Example:

The first row below shows the response to each individual command for Port A (with and without specifying Port A), Port B, and Port C.

The second row shows the response to the generic $JSHOW command with items similar to the first row responses highlighted.

<table>

JSHOW,BIN Command

Command Type:
General Operation and Configuration

Description:
Query receiver for current Bin messages being output

Command Format:
$JSHOW,BIN<CR><LF>

Receiver Response:
$>JSHOW,BIN,B1,B1R,B2,B2R...,Bn,BnR

Where:
- B1 is the first Bin message being output B1R is the rate of B1
- B2 is the second Bin message being output B2R is the rate of B2
- Bn is the last Bin message being output BnR is the rate of Bn

Example:
$>JSHOW,BIN,B01,1.00,B02,1.00,B69,1,B80,1,B89,1,B99,1

Additional Information:

Topic Last Updated: v1.04 / May 29, 2012
JSHOW,CONF Command

Command Type: General Operation and Configuration

Description: Query receiver for configuration settings

Command Format: 
$JSHOW,CONF<CR><LF>

Receiver Response: 
$>JSHOW,CONF,AID,AIDVAL,RES,ELEV,MODE,AGE,DIFF

where:

<table>
<thead>
<tr>
<th>Message Component</th>
<th>Description</th>
<th>As Displayed in Example Below This Table</th>
</tr>
</thead>
</table>
| AID               | Altitude aiding indicator as set by JALT command:  
  - A = ALWAYS  
  - N = NEVER  
  - S = SOMETIME  
  - T = SATS | A |
| AIDVAL            | Altitude aiding value as by JALT command:  
  - If AID = N, then AIDVAL = 0.0  
  - If AID = A, then AIDVAL = height  
  - If AID = S, then AIDVAL = PDOP threshold  
  - If AID = T, then AIDVAL = number of sats | 404.2 |
| RES               | Residual limit for the $JLIMIT command | 10.0 |
| ELEV              | Elevation mask cutoff angle (in degrees) as set by JMASK command | 5 |

\texttt{$>JSHOW,CONF,A,404.2,10.0,5,M,LOW,259200,A$}

Additional Information:

Topic Last Updated: v1.04 / May 29, 2012
JSHOW,GP Command

Command Type:
General Operation and Configuration

Description:
Query the receiver for each GP message currently being output through the current port and the update rate for that message.
To see output for other ports you must specify that port or OTHER.

Command Format:
$JSHOW,GP[,PORTX][,OTHER]<CR><LF>
where:
• ',PORTX' = a port other than the current port, such as Port B or Port C
• ',OTHER' = Port B if the current port is Port A, or Port A if the current port is Port B

Receiver Response:
$>JSHOW,M1,M1R,M2,M2R...,Mn,MnR
Where:
• M1 is the first message being output M1R is the rate of M1
• M1 is the first message being output M1R is the rate of M1
• Mn is the last message being output MnR is the rate of Bn

Example:
$>JSHOW,GP,GGA,1.00,GST,1.00

Additional Information:
Topic Last Updated: v1.04 / May 29, 2012
**JSHOW,THISPORT Command**

**Command Type:**
General Operation and Configuration

**Description:**
Query to determine which receiver port you are connected to

**Command Format:**

$JSHOW,THISPORT<CR><LF>

**Receiver Response:**

$>JSHOW,THISPORT, port

where 'port' is the port you are connected to

**Example:**

Response if you are connected to Port B:

$>JSHOW,THISPORT,PORTB

**Additional Information:**

See JSHOW for information on displaying more configuration information for a receiver

Topic Last Updated: v1.03 / January 11, 2012
JSIGNAL Command

JSIGNAL Command

Command Type:
General Operation and Configuration

Description:
Set the GNSS signals that the receiver will attempt to track. Specific signals shown here are only valid for receivers supporting the signal in question.

Command Format:
Specify the signal(s) to be used:

$JSIGNAL,INCLUDE[,L1CA][,L1P][,L2P][,L2C][,G1][,G2][,E1BC][,B1][,B2][,B3][,E5B],[QZSL1CA],[QZSL2C],[,ALL]<CR><LF>

Specify the signal(s) NOT to be used:

$JSIGNAL,EXCLUDE[,L1CA][,L1P][,L2P][,L2C][,G1][,G2][,E1BC][,B1][,B2][,B3][,E5B],[QZSL1CA],[QZSL2C],[,ALL]<CR><LF>

Query the current setting:

$JSIGNAL,INCLUDE<CR><LF>

Receiver Response:

Response to issuing command to turn functionality on/off

$>

Response to querying the current setting

$>JSIGNAL,INCLUDE[,L1CA][,L1P][,L2P][,L2C][,G1][,G2][,E1BC][,B1][,B2][,B3][,E5B],[QZSL1CA],[QZSL2C]<CR><LF>

Additional Information:

Topic Last Updated: v1.10 / February 16, 2017
JSMOOTH Command

Command Type:

GPS

Description:

Set the carrier smoothing interval (15 to 6000 seconds) or query the current setting

This command provides the flexibility to tune in different environments. The default for this command is 900 seconds (15 minutes) or LONG. A slight improvement in positioning performance (depending on the multipath environment) may occur if you use either the SHORT (300 seconds) or LONG (900 seconds) smoothing interval.

Command Format:

Set the carrier smoothing interval:

To set the carrier smoothing interval to a specific number of seconds issue the following command:

$JSMOOTH,x<CR><LF>

where 'x' is one of the following:

- Number of seconds
- DEFAULT (equals 900 seconds)

Default for e-Dif is 300 second

- SHORT (equals 300 seconds)
- LONG (equals 900 seconds)

Query the current setting:

$JSMOOTH<CR><LF>

Receiver Response:

Receiver response when setting the carrier smoothing interval

$>

Receiver response when querying the current carrier smoothing interval

$>JSMOOTH,x

where 'x' is the word 'SHORT' or 'LONG' followed by the number of seconds used:

- SHORT precedes the number of seconds for any setting less than 900 seconds
- LONG precedes the number of seconds for any setting greater than or equal to 900 seconds

Example:

To set the carrier smoothing interval to 750 seconds issue the following command:

$JSMOOTH,750<CR><LF>
...and if you then query the receiver using $JSMOOTH the response is:

$JSMOOTH,SHORT750

To set the carrier smoothing interval to 300 seconds (5 minutes) issue the following command:

$JSMOOTH,SHORT<CR><LF>

To set the carrier smoothing interval to 900 seconds (15 minutes) issue the following command:

$JSMOOTH,LONG<CR><LF>

Additional Information:

If you are unsure of the best value for this setting, leave it at the default setting of LONG (900 seconds).

The status of this command is also output in the JSHOW message.

Topic Last Updated: v1.04 / May 29, 2012
JSYSVER Command

Command Type:
General Operation and Configuration

Description:
Returns the boot loader version from the GPS card

Command Format:

$JSYSVER<CR><LF>

Receiver Response:

$>SYSVER,v
where 'v' is the boot loader version

Example:

Response when the boot loader version is 75

$>SYSVER,75

Additional Information:

Topic Last Updated: v1.05 / January 18, 2013
JT Command

Command Type:
General Operation and Configuration

Description:
Query the receiver for its GPS engine type

Command Format:
$JT<CR><LF>

Receiver Response:
$>JT,xxxx

where xxxx indicates the GPS engine and mode:

<table>
<thead>
<tr>
<th>JT Command Response (xxxx)</th>
<th>GPS Engine</th>
<th>Mode</th>
</tr>
</thead>
<tbody>
<tr>

</tbody>
</table>

Example:
When you issue the $JT<CR><LF>command a typical response may be:

$>JT,DF2b,MX31rev=28DF2b indicates an Eclipse receiver with WAAS and RTK Base functionality.

Note:
MX31rev=28 is the processor type and only appears as part of the Eclipse receiver response. You can disregard the processor type as the text that precedes it (DF2b in this example) provides the requested information (GPS engine and mode).

Additional Information:

JTAU Commands

JTAU Command Overview

The JTAU command is used to set the time constants for specific parameters for Crescent, Crescent Vector, and Eclipse products.

<table>
<thead>
<tr>
<th>Command</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>JTAU,COG</td>
<td>Set the course over ground time (COG) constant and query the current setting</td>
</tr>
<tr>
<td>JTAU,SPEED</td>
<td>Set the speed time constant and query the current setting</td>
</tr>
</tbody>
</table>

Topic Last Updated: v1.00 / August 11, 2010
JTAU,COG Command

Note:

The JATT,COGTAU command provides identical functionality but works only with Crescent Vector products.

Command Type:

GPS

Description:

Set the course over ground (COG) time constant (0.00 to 3600.00 seconds) or query the current setting.

This command allows you to adjust the level of responsiveness of the COG measurement provided in the GPVTG message. The default value is 0.00 seconds of smoothing. Increasing the COG time constant increases the level of COG smoothing.

Command Format:

Set the COG time constant

$JTAU,COG,tau<CR><LF>

where 'tau' is the new COG time constant that falls within the range of 0.00 to 200.1 seconds

The setting of this value depends upon the expected dynamics of the Crescent. If the Crescent will be in a highly dynamic environment, this value should be set lower because the filtering window would be shorter, resulting in a more responsive measurement. However, if the receiver will be in a largely static environment, this value can be increased to reduce measurement noise.

Query the current setting:

$JTAU,COG<CR><LF>

Receiver Response:

Receiver response when setting the COG time constant

$>

Receiver response when querying the current COG time constant

$>JTAU,COG,tau<CR><LF>

Example:

To set the COG time constants 2 seconds issue the following command:

$JTAU,COG,2<CR><LF>

Additional Information:

You can use the following formula to determine the COG time constant: \( \tau = \frac{10}{\text{maximum rate of change of course (in } ^\circ/\text{s)}} \)

If you are unsure about the best value for this setting, it is best to be conservative and leave it at the default setting of 0.00 seconds.

Topic Last Updated: v1.02 / January 25, 2011
JTAU,SPEED Command

Command Type:
GPS

Description:
Set the speed time constant (0.00 to 3600.00 seconds) or query the current setting.

This command allows you to adjust the level of responsiveness of the speed measurement provided in the GPVTG message. The default value is 0.00 seconds of smoothing. Increasing the speed time constant increases the level of speed measurement smoothing.

Command Format:
Set the speed time constant:

$JTAU,SPEED,tau<CR><LF>

where 'tau' is the new speed time constant that falls within the range of 0.0 to 200.2 seconds.

The setting of this value depends upon the expected dynamics of the receiver. If the receiver will be in a highly dynamic environment, you should set this to a lower value, since the filtering window will be shorter, resulting in a more responsive measurement. However, if the receiver will be in a largely static environment, you can increase this value to reduce measurement noise.

Query the current setting:
$JTAU,SPEED<CR><LF>

Receiver Response:
Receiver response when setting the speed time constant
$>

Receiver response when querying the current speed time constants
$>JTAU,SPEED,tau<CR><LF>

Example:
To set the speed time constant as 4.6 seconds issue the following command:
$JTAU,SPEED,4.6<CR><LF>

Additional Information:

You can use the following formula to determine the COG time constant (Hemisphere GNSS recommends testing how the revised value works in practice): tau (in seconds) = 10 / maximum acceleration (in m/s²)

If you are unsure about the best value for this setting, it is best to be conservative and leave it at the default setting of 0.00 seconds.

Topic Last Updated: v1.06 / March 10, 2015
JTIMG Commands

$JTIMG,ATLASCLOCK,YES/NO Command

Command Type:
General operation and configuration

Description:
Enable/disable receiver clock steering by the Atlas solution.

Command Format:
To enable Atlas clock steering:
$JTIMG,ATLASCLOCK,YES<CR><LF>

To disable Atlas clock steering:
$JTIMG,ATLASCLOCK,NO<CR><LF>

Query the current setting:
$JTIMG,ATLASCLOCK<CR><LF>

Receiver Response:
Response to issuing command to enable/disable Atlas clock steering:
$>

Response to querying the current setting:
$>JTIMG,ATLASCLOCK,[YES/NO]

Example:

Additional Information:
Clock steering by Atlas is disabled by default.

Topic Last Updated: v.3.0 / December 30, 2019
$JTIMG,MANUALMARK[yes/no] Command

Command Type:
General operation and configuration

Description:
The $JTIMG,MANUALMARK[yes/no] command is used to enable or disable manual mark.

Command Format:
To enable manual mark:
$JTIMG,MANUALMARK,YES<CR><LF>

To disable manual mark:
$JTIMG,MANUALMARK,NO<CR><LF>

Query the current setting:
$JTIMG,MANUALMARK<CR><LF>

Receiver Response:
Response to issuing command to enable/disable manual mark:
$>

Response to querying the current setting:
$>JTIMG,MANUALMARK, [YES/NO]

Example:

Additional Information:
Manual mark mode is enabled by default.

Topic Last Updated: v.3.0 / December 30, 2019
$JTIMING,HALTCLOCKSTEER,YES Command

Command Type:
General operation and configuration

Description:
The $JTIMING,HALTCLOCKSTEER command is used to prevent GNSS clock steering, for use with external atomic ref
clocks.

Command Format:
To disable GNSS clock steering:
$JTIMING,HALTCLOCKSTEER,YES<CR><LF>
To enable GNSS clock steering:
$JTIMING,HALTCLOCKSTEER,NO<CR><LF>
Query the current setting:
$JTIMING,HALTCLOCKSTEER<CR><LF>

Receiver Response:
Response to issuing command to enable/disable GNSS clock steering:
$>
Response to querying the current setting:
$>JTIMING,HALTCLOCKSTEER,[YES/NO]

Example:

Additional Information:
GNSS clock steering is enabled by default. This command can be used to prevent clock steering, for example, if using an
external atomic reference clock.

Topic Last Updated: v.3.0 / December 30, 2019
PCSI Commands

PCSI,1 Command (Status Line A, Channel 0 command)

Command Type:
Beacon Receiver

Description:
Hemisphere GNSS proprietary NMEA 0183 query
Query the SBX for a selection of parameters related to the operational status of its primary channel

Command Format:
$PCSI,1<CR><LF>

Receiver Response:
$PCSI,ACK,1
$PCSI,CS0,PXXX-Y.YYY,SN,fff.f,M,ddd,R,SS,SNR,MTP,WER,ID,H,T,G

where:

<table>
<thead>
<tr>
<th>Response Component</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>CS0</td>
<td>Channel 0</td>
</tr>
<tr>
<td>PXXX-Y.YYY</td>
<td>Resident SBX firmware version</td>
</tr>
<tr>
<td>SN</td>
<td>SBX receiver serial number</td>
</tr>
<tr>
<td>fff.f</td>
<td>Channel 0 current frequency</td>
</tr>
<tr>
<td>M</td>
<td>Frequency mode (A = automatic, M = manual, D = database)</td>
</tr>
<tr>
<td>ddd</td>
<td>MSK bit rate</td>
</tr>
<tr>
<td>R</td>
<td>RTCM rate mode (A = automatic, M = manual, D = database)</td>
</tr>
<tr>
<td>SS</td>
<td>Signal strength</td>
</tr>
<tr>
<td>SNR</td>
<td>Signal-to-noise ratio</td>
</tr>
<tr>
<td>MTP</td>
<td>Message throughput</td>
</tr>
<tr>
<td>WER</td>
<td>Word Error Rate - Percentage of bad 30-bit RTCM words in the last 25 words</td>
</tr>
<tr>
<td>ID</td>
<td>Beacon ID to which the receiver’s primary channel is tuned</td>
</tr>
<tr>
<td>H</td>
<td>Health of the tuned beacon [0-7]</td>
</tr>
<tr>
<td>T</td>
<td>$PCSI,1 status output period [0-99]</td>
</tr>
<tr>
<td>G</td>
<td>AGC gain in dB (0 to 48 db)</td>
</tr>
</tbody>
</table>
Additional Information:

Optionally you can modify the Status Line A query to request the output of the response message once every period at a specified output rate. It has the following format, where 'T' is the output period in seconds:

$PCSI,1,T<CR><LF>

The response will be:

$PCSI,ACK,1

$PCSI,CS0,PXXY.YYY,SN,fff.f,M,ddd.R,SS,SNR,MTP,WER,ID,H,T,G

You can stop the output of the message by either of the following:

- Cycling receiver power
- Issuing the $PCSI,1<CR><LF> query without the output period field

The response message has the same format as discussed above. In addition to this modified version of the Status Line A command, an additional 'S' field may be placed after the 'T' field, resulting in the following command:

$PCSI,1,T,S<CR><LF>

The 'S' field is not a variable and specifies that the output of the Status Line A message should continue after the power has been cycled. To return the receiver to the default mode (in which message output ceases after receiver power is cycled) send the $PCSI,1<CR><LF> query to the receiver.

You may send the $PCSI,1 query through either serial port for reporting of the full status of the primary receiver channel. The query response is returned to the port from which you issued the command. When querying the primary receiver channel using the secondary serial port, no interruptions in RTCM data output will occur on the primary port provided the SBX has acquired a valid beacon.

The response is different depending on whether you are connected directly to the SBX-4 or not.

- If connected directly (by hardware or JCONN), the response will be both an acknowledgement as well as the full PCSI,1 message.
- If connected through a Crescent receiver (such as the R110) you may see the full PCSI,1 message. Consider PCSI,1,1 to generate periodic output.

Topic Last Updated: v1.06 / March 10, 2015
**PCSI,1,1 Command (Beacon Status command)**

**Command Type:**

Beacon Receiver

**Description:**

Obtain PCSI,CS0 beacon status data from an SBX engine when interfaced to the receiver Port D. When you send this command through either Port A, B, or C it is automatically routed to Port D. The resulting PCSI,CS0 message is returned to the same port from which the command was sent at the desired rate.

**Command Format:**

$PCSI,1,1<CR><LF>

**Receiver Response:**

$PCSI,CS0,Pxxx-y.yyy,SN,fff.f,M,ddd,R,SS,SNR,MTP,WER,ID,H,T,G

where:

<table>
<thead>
<tr>
<th>Response Component</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>CS0</td>
<td>Channel 0</td>
</tr>
<tr>
<td>PXXX-Y.YYY</td>
<td>Resident SBX firmware version</td>
</tr>
<tr>
<td>SN</td>
<td>SBX receiver serial number</td>
</tr>
<tr>
<td>fff.f</td>
<td>Channel 0 current frequency</td>
</tr>
<tr>
<td>M</td>
<td>Frequency mode (A = automatic, M = manual, D = database)</td>
</tr>
<tr>
<td>ddd</td>
<td>MSK bit rate</td>
</tr>
<tr>
<td>R</td>
<td>RTCM rate mode (A = automatic, M = manual, D = database)</td>
</tr>
<tr>
<td>SS</td>
<td>Signal strength</td>
</tr>
<tr>
<td>SNR</td>
<td>Signal-to-noise ratio</td>
</tr>
<tr>
<td>MTP</td>
<td>Message throughput</td>
</tr>
<tr>
<td>WER</td>
<td>Word Error Rate - Percentage of bad 30-bit RTCM words in the last 25 words</td>
</tr>
<tr>
<td>ID</td>
<td>Beacon ID to which the receiver's primary channel is tuned</td>
</tr>
<tr>
<td>H</td>
<td>Health of the tuned beacon (0-7)</td>
</tr>
<tr>
<td>T</td>
<td>$PCSI,1 status output period (0-99)</td>
</tr>
<tr>
<td>G</td>
<td>AGC gain in, dB (0 to 48)</td>
</tr>
</tbody>
</table>

**Example:**

$PCSI,CS0,P030-0.000,19001,313.0,D,100,D,18,8,80,0,63,0,1,48
PCSI,2 Command (Status Line B, Channel 1 command)

Command Type:
Beacon Receiver

Description:
Hemisphere GNSS proprietary NMEA 0183 query
Query the SBX to output a selection of parameters related to the operational status of its secondary channel

Command Format:
$PCSI,2<CR><LF>

Receiver Response:
$PCSI,ACK,2

$PCSI,CS1,PXXX-Y.YYY,SN,fff.f,M,ddd,R,SS,SNR,MTP,WER,ID,H,T

Where:

<table>
<thead>
<tr>
<th>Response Component</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>CS1</td>
<td>Channel 1</td>
</tr>
<tr>
<td>PXXX-Y.YYY</td>
<td>Resident SBX firmware version</td>
</tr>
<tr>
<td>SN</td>
<td>SBX receiver serial number</td>
</tr>
<tr>
<td>fff.f</td>
<td>Channel 1 current frequency</td>
</tr>
<tr>
<td>M</td>
<td>Frequency mode (A = automatic, M = manual, D = database)</td>
</tr>
<tr>
<td>ddd</td>
<td>MSK bit rate</td>
</tr>
<tr>
<td>R</td>
<td>RTCM rate mode (A = automatic, M = manual, D = database)</td>
</tr>
<tr>
<td>SS</td>
<td>Signal strength</td>
</tr>
<tr>
<td>SNR</td>
<td>Signal to noise ratio</td>
</tr>
<tr>
<td>MTP</td>
<td>Message throughput</td>
</tr>
<tr>
<td>WER</td>
<td>Word error rate - Percentage of bad 30-bit RTCM words in the last 25 words</td>
</tr>
<tr>
<td>ID</td>
<td>Beacon ID to which the receiver’s secondary channel is tuned</td>
</tr>
<tr>
<td>H</td>
<td>Health of the tuned beacon (0-7)</td>
</tr>
<tr>
<td>T</td>
<td>$PCSI,1 status output period (0-99)</td>
</tr>
</tbody>
</table>

Example:

$PCSI,ACK,2
Additional Information:

Optionally you can modify the Status Line B query to request the output of the response message once every period. It has the following format, where T is the output period in seconds:

$PCSI,2,T<CR><LF>

The response will be:

$PCSI,ACK,2

$PCSI,CS0,PXXX-Y.YYY,SN,fff.f,M,ddd,R,SS,SNR,MTP,WER,ID,H,T

The response message has the same format as discussed above. The Status Line B message output cannot be set to remain active after the power of the SBX has been cycled.

The $PCSI,2 query may be sent through the either serial port for reporting of the full status of the secondary receiver channel. The response to the query is returned to the port from which the command was issued. When querying the secondary receiver channel using the secondary serial port, no interruptions in RTCM data output will occur on the primary port provided that SBX has acquired a valid beacon.

Topic Last Updated: v1.06 / March 10, 2015
PCSI,3,1 Command (Receiver Search Dump command)

Command Type:
Beacon Receiver

Description:
Hemisphere GNSS proprietary NMEA 0183 query

Query the SBX to output the search information used for beacon selection in Automatic Beacon Search mode. The output has three frequencies per line.

Command Format:
$PCSI,3,1<CR><LF>

Receiver Response:
$PCSI,ACK,3,1
$PCSI,tag1,freq1,ID1,chan1,snr1,ss1,tag2,freq2,ID2,chan2,snr2,ss2, tag3,freq3,ID3,chan3,snr3,ss3

where:

<table>
<thead>
<tr>
<th>Response Component</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>tag</td>
<td>Channel number with a range of 1 to 84</td>
</tr>
<tr>
<td>freq</td>
<td>Channel frequency (kHz * 10)</td>

PCSI,3,3 Command (Station Database command)

Command Type:
Beacon Receiver

Description:
Display the contents of the beacon station database

Command Format:
$PCSI,3,3<CR><LF>

Receiver Response:

$PCSI,ACK,3,3
$PCSI,3,3,IDref1,IDref2,StationID,name,freq,lat,long,datum,status
$PCSI,3,3, ...
$PCSI,3,3, ...
$PCSI,3,3, ...
$PCSI,3,3, ...
...

Where:

<table>
<thead>
<tr>
<th>Response Component</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>IDref1</td>
<td>Beacon reference ID (primary)</td>
</tr>
<tr>
<td>IDref2</td>
<td>Beacon reference ID (secondary)</td>
</tr>
<tr>
<td>StationID</td>
<td>Specific ID number for beacon stations (appears in the last field of the GPGGA message)</td>
</tr>
<tr>
<td>name</td>
<td>Name of station</td>
</tr>
<tr>
<td>freq</td>
<td>Frequency, in kHz (scaled by 10), on which the station is transmitting. In the first line of the Example below, 2950 indicates 295.0 kHz.</td>
</tr>
<tr>
<td>lat</td>
<td>Scaled by 364 (+ve indicates N and -ve indicates S)</td>
</tr>
<tr>
<td>long</td>
<td>Longitude is scaled by 182 (+ve indicates N and -ve indicates S)</td>
</tr>
<tr>
<td>datum</td>
<td>1 (NAD83), 0(WGS84)</td>
</tr>
<tr>
<td>status</td>
<td>0 (operational), 1(undefined), 2 (no information), 3, (do not use)</td>
</tr>
</tbody>
</table>

Example

Additional Information:
Topic Last Updated: v1.04 / May 29, 2012
PCSI,4 Command (Wipe Search command)

Description:
Clear search history in Auto mode

Command Format:

$PCSI,4<CR><LF>

Receiver Response:

$PCSI,ACK,4

Example:

Additional Information:

Topic Last Updated: v1.04 / May 29, 2012
PCSI,5 Command (Set Baud Rates command)

Command Type:
Beacon Receiver

Description:
Set the baud rate of Port0 and Port1

The baud rate for Port0 is saved for next power up; however, the baud rate for Port1 always defaults to 4800.

Note:
This command applies when you connect directly to a beacon board, as this command has no effect when a beacon board is integrated with a GNSS receiver.

Command Format:
$PCSI,5,portrate0,portrate1<CR><LF>

Where:
- portrate0 = desired baud rate for Port0
- portrate1 = desired baud rate for Port1

Receiver Response:
$>

Example:

Additional Information;

Topic Last Updated: v1.07 / February 16, 2017
PCSI,6 Command (Reboot command)

Command Type:
Beacon Receiver

Description:
Reboot SBX receiver

Command Format:

$PCSI,6<CR><LF>

Receiver Response:
See example below.

Example:
When sending this command your response will appear similar to the below:

$PCSI,S/N:00019001
$PCSI,FCFGcrc,B5E5,CCFGcrc,B5E5,Pass
$PCSI,FGLBcrc,19BC,CGLBcrc,19BC,Pass
$PCSI,FLSHcrc,0531 Pass
$PCSI,FSTAcrc,56C3 Base,2FB2,B077

Additional Information:

Topic Last Updated: v1.04 / May 29, 2012
PCSI,7 Command (Swap Modes command)

Command Type:
Beacon Receiver

Description:
Swap modes on the receiver (allowing you to output RTCM and PCSI on the desired ports—Port 0 and Port 1)

Note:
This command applies when you connect directly to a beacon board, as this command has no effect when a beacon board is integrated with a GNSS receiver.

Command Format:
$PCSI,7,mode<CR><LF>

where mode is:

- 1 = PCSI on Port1 and RTCM on Port0
- 2 = PCSI on Port0 and RTCM on Port1

Receiver Response:
$PCSI,ACK,7,mode

For example, when sending the following command...

$PCSI,7,1<CR><LF>

... the response is:

$PCSI,ACK,7,1

Example:

/* A NOTE ON DECODING MESSAGE 76
* Notation: "code" -- is taken to mean the PseudoRange derived from code phase.
* "phase" -- is taken to mean range derived from carrier phase.
* This will contain cycle ambiguities.
*
* Only the lower 16 bits of L1P code, L2P code and the lower 23 bits of
* carrier phase are provided. The upper 19 bits of the L1CA code are found
* in m_aulCACodeMSBsPRN[]. The upper 19 bits of L1P or L2P must be derived
* using the fact that L1P and L2P are within 128 meters of L1CA. To
* determine L1P or L2P, use the lower 16 bits provided in the message and
* set the upper bits to that of L1CA. Then add or subtract one LSB of the
* upper bits (256 meters) so that L1P or L2P are within 1/2 LSB (128 meters)
* of the L1CA code.
* The carrier phase is in units of cycles, rather than meters,
* and is held to within 1023 cycles of the respective code range. Only
* the lower 16+7=23 bits of carrier phase are transmitted in Msg 76.
* In order to determine the remaining bits, first convert the respective
* code range (determined above) into cycles by dividing by the carrier
* wavelength. Call this the "nominal reference phase". Next extract the 16
* and 7 bit blocks of carrier phase from Msg 76 and arrange to form the lower
* 23 bits of carrier phase. Set the upper bits (bit 23 and above) equal to
* those of the nominal reference phase. Then, similar to what was done for
* L1P and L2P, add or subtract the least significant upper bit (8192 cycles)
* so that carrier phase most closely agrees with the nominal reference phase
* (to within 4096 cycles).

Bin1 Message

Message Type:

Binary

Description:

GNSS position message (position and velocity data)

Command Format to Request Message:

$JBIN,1,r<CR><LF>

where:

'1' = Bin1 message

'r' = message rate in Hz (20, 10, 2, 1, 0, or .2)

Message Format:

Bin2 Message

Message Type:
Binary

Description:
GPS DOPs (Dilution of Precision)
This message contains various quantities that are related to the GNSS solution, such as satellites tracked, satellites used, and DOPs.

Command Format to Request Message:
$JBIN,2,r<CR><LF>

where:
- '2' = Bin2 message
- 'r' = message rate in Hz (1 or 0)

Message Format:

<table>

Bin76 Message

Message Type:

Binary

Description:
GPS L1/L2 code and carrier phase information

Note:
"Code" means pseudo range derived from code phase. "Phase" means range derived from carrier phase. This will
contain cycle ambiguities.

Only the lower 16 bits of L1P code, L2P code and the lower 23 bits of carrier phase are provided. The upper 19 bits of the
L1CA code are found in m_aulCACodeMSBsPRN[]. The upper 19 bits of L1P or L2P must be derived using the fact L1P
and L2P are within 128 m (419.9 ft) of L1CA.

To determine L1P or L2P:
1. Use the lower 16 bits provided in the message.
2. Set the upper bits to that of L1CA.
3. Add or subtract on LSB of the upper bits (256 meters (839.9 feet)) so that L1P or L2P are within 1/2 LSB (128 m
   (419.9 ft))

The carrier phase is in units of cycles, rather than meters, and is held to within 1023 cycles of the respective code range.
Only the lower 16+7 = 23 bits of carrier phase are transmitted in Bin 76.

To determine the remaining bits:
1. Convert the respective code range (determined above) into cycles by dividing by the carrier wave length. This is
   the nominal reference phase.
2. Extract the 16 and 7 bit blocks of carrier phase from bin 76 and arrange it to form the lower 23 bits of carrier
   phase.
3. Set the upper bits (bit 23 and above) equal to those of the nominal reference phase
4. Add or subtract the least significant upper bit (8192 cycles) so that carrier phase most closely agrees with the
   nominal reference phase (to within 4096 cycles).

Command Format to Request Message:
$JBIN,76,r<CR><LF>

Where:
'76' = Bin76message
'r' = message rate in Hz (20, 10, 2, 1, 0, or .2)

Null (empty) fields occur when there is no information for that field. You can use the JNP command to specify the number of decimal places output in the GPGGA and GPGLL messages.

What does <CR><LF> mean?

The literal translation means "Carriage Return, Line Feed." These are terms used in computer programming languages to describe the end of a line or string of text. If you are writing your own communication software for a receiver, see some of the examples below. If you are already using a program such as Hemisphere GNSS' PocketMax, when you click to send a command to the receiver, the program adds the carriage return and line feed to the end of the text string for you. If you are using HyperTerminal or other terminal software, typically the Enter key on your keyboard is set to send the <CR><LF> pair. You may need to define this in the setup section of the terminal software. Some software may treat the Enter key on your numeric keypad differently than the main Enter key in the main QWERTY section of the keyboard – use the main Enter key for best results.

Electronics use different ways to represent the <CR><LF> characters. In ASCII numbers, <CR> is represented as 13 in decimal, or 0D in hexadecimal. ASCII for <LF> is 10 decimal, or 0A hexadecimal. Some computer languages use different ways to represent <CR><LF>. Unix and C language can use "\x0D\x0A". C language can also use "\r\n" in some instances. Java may use CR+LF. In Unicode, carriage return is U+000D, and line feed is U+000A. It is advised to clearly understand how to send these characters if you are writing your own interface software.

GLMLA Message

Message Type:
GLONASS

Description:
GLONASS almanac data

Contains complete almanac data for one GLONASS satellite. Multiple sentences may be transmitted, one for each satellite in the GLONASS constellation.

Command Format to Request Message:
$JASC,GLMLA,[r,OTHER]<CR><LF>

where:

'r' = 1 (on) or 0 (off) When set to on the message is sent once (one message for each tracked satellite at 1 second intervals) and then sent again whenever satellite information changes

',OTHER' = optional field, enacts a change on the current port when you send the command without it (and without the brackets) and enacts a change on the other port when you send the command with it (without the brackets)

Message Format:
$GLMLA,A.A,B.B,CC,D.D,EE,FFFF,GG,HHHH,III,JJJJJJ,KKKKKK,MMMMMM,NNNNNN,PPP,QQQ*hh<CR><LF>

where:

MM

Mode indicator

Variable length valid character field type with the first two characters currently defined.

- First character indicates the use of GPS satellites
- Second character indicates the use of GLONASS satellites

If another satellite system is added to the standard, the mode indicator will be extended to three characters. New satellite systems shall always be added on the right, so the order of characters in the Mode Indicator is: GPS, GLONASS, other satellite systems in the future.

The characters shall take one of the following values:

- N = No fix. Satellite system not used in position fix, or fix not valid
- A = Autonomous. Satellite system used in non-differential mode in positionfix
- D = Differential. Satellite system used in differential mode in positionfix
- P = Precise. Satellite system used in precision mode. Precision mode is defined as no deliberate degradation (such as Selective Availability) and higher resolution code (P-code) is used to compute position fix.
- R = Real Time Kinematic. Satellite system used in RTK mode with fixed integers
- F = Float RTK. Satellite system used in real time kinematic mode with floating integers
- E = Estimated (dead reckoning) mode
- M = Manual input mode
- S = Simulator mode

The mode indicator shall not be a null field.

QQ

Number of satellites used in position solution

P.P

Horizontal dilution of precision (HDOP)

A.A

Antenna altitude, in meters, re: mean-sea-level (geoid)

G.G

Geoidal separation (in meters)

SSS

Age of differential corrections, in seconds

RRRR

Differential reference station ID
NS  Navigational status; options are:

- S = Safe
- C = Caution
- U = Unsafe
- V = Not valid for navigation

*CC  Checksum

<CR>  Carriage return

<LF>  Line feed

Example:

$GPGNS,224749.00,3333.4268304,N,11153.3538273,W,D,19,0.6,406.110,-26.294,6.0,0138,S,*6A

Additional Information:

This message provides information specific to the satellite system identified by the first two characters of the message.

GPGNS - GPS information
GNGNS - GNSS information
GLGNS - GLONASS information
GAGNS – GALILEO information

The JNMEA,GGAALLGNSS command significantly affects the output of the GNS message. If you are tracking more than
GNSS sign Hemisphere GNSS highly recommends that you review this command.

M  Mode indicator

Variable length valid character field type with the first two characters currently defined.

- First character indicates the use of GPS satellites

If another satellite system is added to the standard, the mode indicator will be extended to three characters. New satellite systems shall always be added on the right, so the order of characters in the Mode Indicator is: GPS, GLONASS, other satellite systems in the future.

The characters shall take one of the following values:

- N = No fix. Satellite system not used in position fix, or fix not valid
- A = Autonomous. Satellite system used in non-differential mode in position fix
- D = Differential. Satellite system used in differential mode in position fix
- P = Precise. Satellite system used in precision mode. Precision mode is defined as no deliberate degradation (such as Selective Availability) and higher resolution code (P-code) is used to compute position fix.
- R = Real Time Kinematic. Satellite system used in RTK mode with fixed integers
- F = Float RTK. Satellite system used in real time kinematic mode with floating integers
- E = Estimated (dead reckoning) mode
- M = Manual input mode
- S = Simulator mode

The mode indicator shall not be a null field.

NS  Navigational status; options are:

- S = Safe
- C = Caution
- U = Unsafe
- V = Not valid for navigation

*CC  Checksum

<CR>  Carriage return

<LF>  Line feed

JASC.GP

Topic Last Updated: v1.04 / May 29, 2012
PSAT, HPR Message

Message Type:

Data

Description:

Proprietary NMEA message that provides the true heading, pitch, roll, and time in a single message

This message provides heading, pitch and roll. Heading is derived from GNSS. If $JATT,ROLL,YES is set roll will be derived from GNSS and pitch will come from the inertial sensor. If $JATT,ROLL,NO is set, pitch will be derived from GNSS and roll will come from the inertial sensor. While coasting heading is based on gyro and pitch/roll are from the inertial sensor. To know when the receiver is coasting, see the TYPE field below.

Command Format to Request Message:

$JASC,GPHPR,r[,OTHER]<CR><LF>

where:

• ‘r’ = message rate in Hz of 20, 10, 2, 1, 0 or .2 (0 turns off the message)

• ‘,OTHER’ = optional field, enacts a change on the current port when you send the command without (and without the brackets) and enacts a change on the other port when you send the command with it (without the brackets)

Additional Information:

Related Commands:

JASC,GP
$JATT,ROLL
PSAT, INTLT Message

Message Type:
Data

Description:
Proprietary NMEA message that provides the tilt measurements from the internal inclinometers in degrees. It delivers an output of crude accelerometer measurements of pitch and roll with no temperature compensation or calibration for GPS heading/pitch/roll.

Pitch and roll are factory calibrated over temperature to be accurate to ±3°C.

CAUTION: User calibration will clear out precise factory calibration.

Command Format to Request Message:
$JASC,INTLT,r[,OTHER]<CR><LF>

where:

• 'r' = message rate in Hz of 1 or 0 (0 turns off the message)

• 'r', 'OTHER' = optional field, enacts a change on the current port when you send the command without it (and without the brackets) and enacts a change on the other port when you send the command with it (without the brackets)

PSAT, RPTKPROG Message

**Message Type:**

Data, Local Differential and RTK

**Description:**

Contains RTK fix progress information

$JASC,PSAT,RPTKPROG,r[,OTHER]<CR><LF>

**Command Format to Request Message:**

where:

- 'r' = message rate in Hz of 1 or 0 (0 turns off the message)
- ',OTHER' = optional field, enacts a change on the current port when you send the command without it (and without the brackets) and enacts a change on the other port when you send the command with it (without the brackets)

**Message Format:**

$PSAT,RPTKPROG,,R,F,N,SS1,SS2,SS3,MASK*CC<CR><LF>

where:

<table>
<thead>
<tr>
<th>Message Component</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>R</td>
<td>1 = Ready to enter RTK ambiguity fix 0 = Not ready to enter RTK ambiguity fix</td>
</tr>
<tr>
<td>F</td>
<td>1 = Receiver running in RTK ambiguity fix mode 0 = Receiver not running in RTK ambiguity fix mode</td>
</tr>
<tr>
<td>N</td>
<td>Number of satellites used to fix</td>
</tr>
<tr>

<td>Checksum</td>
</tr>
<tr>
<td>&lt;CR&gt;</td>
<td>Carriage return</td>
</tr>
<tr>
<td>&lt;LF&gt;</td>
<td>Line feed</td>
</tr>
</tbody>
</table>

**Example:**

$PSAT,RPTKPROG,1,1,24,243.0,0.0,0.0,0,3*4F<CR><LF>
• Ready to enter RTK ambiguity fix
• Receiver running in RTK ambiguity fix mode
• 24 satellites used to fix summer-1 is 243.0, summer-2 is 0, summer-3 is 0
• Bit mask is 3 (GPS + GLONASS)

Additional Information:
Issuing the JSAVE command after setting JASC,PSAT,RTKPROG to 1 (message on at 1Hz) does not save this setting. You must enable JASC,PSAT,RTKPROG (set it to 1) each time you power on the receiver.

Related Commands:

</thead>
<tbody>
<tr>
<td>• 0 (little or no scintillation - does not adversely affect RTK solution)</td>
<td></td>
</tr>
<tr>
<td>• 1-100 (scintillation detected - adversely affects RTK solution)</td>
<td></td>
</tr>
</tbody>
</table>

| **CC** | Checksum |
| <CR> | Carriage return |
Example:

$PSAT,RTKSTAT,FIX,ROX,1,007F,9.5,\{(L1,L2,G1,G2),(14,11,9,9),(A,A,A,A),0,1,0.011,000

- Fixed mode
- ROX corrections
- Diff age = 1 second
- Subscribed options = 7F (see Understanding Additive Codes for information on subscriptions)
- Distance to base = 9.5 km
- L1,L2,G1,G2 are the systems in use
- Satellites used: L1 = 14, L2 = 11, G1 = 9, G2 = 9
- SNR quality is (> 20 dB), (> 20 dB), (> 20 dB), (> 20dB)
- Rover slip flag = 0
- Base slip flag = 1
- RTK accuracy status = 000 (no issues or errors)
- Little or no ionospheric scintillation

Additional Information:

Issuing the JSAVE command after setting JASC,PSAT,RTKSTAT to 1 (message on at 1Hz) does not save this setting. You must execute JASC,PSAT,RTKSTAT (set it to 1) each time you power on the receiver.

<th>Value</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>h</td>
<td>Heading aided mode (settling) - The System is receiving heading aiding signals from a gyrocompass but is still awaiting the end of the three minutes settling period after power-on or a change of mode or heave bandwidth. The gyrocompass takes approximately five minutes to settle after it has been powered on. During this time, gyrocompass aiding of the System will not be perfect. The status flag does NOT indicate this condition.</td>
</tr>
<tr>
<td>F</td>
<td>Full aided mode (settled condition) - The System is receiving and using aiding signals from a gyrocompass and from a GNSS receiver or a Doppler log.</td>
</tr>
<tr>
<td>M</td>
<td>Space if positive; minus if negative</td>
</tr>
</tbody>
</table>
RRRR | Roll, in units of 0.01 degrees (ex: 1000 = 10°), with a range of –99.99° to +99.99°
---|---
S | Space character
M | Space if positive; minus if negative
PPPP | Pitch, in units of 0.01 degrees (ex: 1000 = 10°), with a range of –99.99° to +99.99°
<CR> | Carriage return
<LF> | Line feed

Example:

:020010 -0001F 0023 -0169

where:

- XX = 02, horizontal acceleration, which is 7.66 cm/s²
- (XX = 02 (hex) = decimal 2, multiplied by 3.83 cm/s² yields 7.66 cm/s²)
- AAAA = 0010, vertical acceleration, which is 1 cm/s²
- (AAAA = 0010 (hex), which = decimal 16, multiplied by 0.0625 cm/s² yields 1 cm/s²)
- S = (space)
- M = (minus), meaning following heave value is negative
- HHHH = 0001, heave, which is 1 cm (-1 cm based on the M value)
- Q = F, status flag, which is full aided mode
- M = (space), meaning following roll value is positive
- RRRR = 0023, roll, which is 0.23°
- S = (space)
- M = (minus), meaning following pitch value is negative
- PPPP = 0169, pitch, which is 1.69°

RTCM SC-104 Protocol

RTCM SC-104 is a standard that defines the data structure for differential correction information for a variety of differential correction applications. It was developed by the Radio Technical Commission for Maritime services (RTCM) and has become an industry standard for communication of correction information. RTCM is a binary data protocol and is not readable with a terminal program. Because it is a binary format and not ASCII text, it appears as "garbage" data on screen.

See Reference Documents for RTCM contact information to purchase a copy of the RTCM SC-104 specifications.

Topic Last Updated: v1.07 / February 16, 2017
Hemisphere GNSS Proprietary Binary Interface

Hemisphere GNSS proprietary binary messages may be output from the receiver simultaneously with NMEA 0183 messages.

Binary messages are inherently more efficient than NMEA 0183 and would be used when maximum communication efficiency is required. Some receiver-specific pieces of information are only available through binary messages, such as raw data for post processing.

Topic Last Updated: v1.06 / March 10, 2015
Subscriptions Codes

This section covers:

- Finding the serial number and inputting a subscription code (e-Dif, RTK, 20 Hz or 10Hz, etc.) into a Hemisphere GNSS receiver
- Viewing the status and interpreting the $JI subscription date codes
- The difference between the receiver’s response to the $JK and $JI commands

Topic Last Updated: v1.07/ February 16, 2017
Interpreting the $JK 'Date'/Subscription Codes

Subscription codes enable GNSS differential correction sources on your receiver. When discussing them it is important to understand the following.

The YYYY component of a MM/DD/YYYY formatted date—returned by the $JK command—is not always just the year component of that date. When a date's year starts with 30, only the 30 represents the year - and that year is 3000. A subscription expiration date of 01/01/3000 effectively means there is no expiration date.

The last two digits of the 30YY 'date' represent the data output rate and the GNSS differential correction sources that have been subscribed to and are therefore enabled on your receiver. Hemisphere GNSS refers to these two digits as the Additive Code (see Understanding Additive Codes).

The 30 and the 00 in the 'year' 3000, then, represents "Expires 3000 (so effectively does not expire), the data rate is 10 Hz, and SBAS is enabled." The 'year' 3015 indicates "Expires 3000, the data rate is 20 Hz and differential correction sources SBAS/e-Dif/RTK and L-Dif have been subscribed to and are enabled."

Below is an example of the $JK command response, part of which is the subscription start and expiration dates (the Date Code is shaded).

$>JK,01/01/3000,0

Topic Last Updated: v1.09 / January 8, 2018
### Understanding Additive Codes

There are several ways to check which activations and subscriptions are on your receiver. Activations and subscriptions are typically shown as a bitmask. The definition of the bitmask is as follows:

<table>
<thead>
<tr>
<th>Hex Value</th>
<th>Subscription/Activation</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>0x01</td>
<td>20HZ</td>
<td>Add the ability to output some messages at rates up to 20Hz</td>

Send the $JK,SHOW command to check which activation and subscriptions are on your receiver.

$>JK,SHOW,475,C60,12/31/2025,0,OPT=,20Hz,RTK,RAW_DATA,L2_L5,MULTI_GNSS,ATLAS_LBAND,ATLAS_10cm

This command lists the receiver activations, subscriptions, and downgrades. In the example above, the receiver is activated and/or subscribed for 20Hz, RTK, raw data output, mFreq (L2_L5), mGNSS, Atlas tracking, and H10. However, some are permanent activations and others are temporary subscriptions. To distinguish one from another, check the 3rd, 4th, and 6th fields.

The 3rd field (475 in this case) is a hexadecimal bitmask showing what your receiver is activated for permanently. 0x475 = 0x01 | 0x04 | 0x10 | 0x20 | 0x40 | 0x400. Match those with the above, and we have 20Hz, RTK, raw data, mFreq, mGNSS, and Atlas tracking that will never expire.

Next, the following field (C60) is a hexadecimal bitmask of what will expire (the expiration date is in the following field, 31st of December 2025).

0xC60 = 0x800 | 0x400 | 0x40 | 0x20. This receiver has a temporary subscription for Atlas H10, L-band tracking, mGNSS, and mFreq. Those subscriptions will expire. However, please note that even after the subscription expires, the receiver will still have mGNSS, mFreq, and Atlas L-band tracking since those are also permanent activations.

The field after the date (0 in this case) is the downgrade bit field. This receiver doesn’t have any downgrade bits.

The $JK command response:

$>JK,12/31/2025,C75

C75 is a hexadecimal bitmask of subscriptions and activations, but it does not specify what will expire on the 31st of December, 2025. Therefore, this command is less desirable.

0xC75 = 0xC60 | 0x475.

Another option is the $JI response. This response gives you a decimal bitmask + 3000. In the example below, the bitmask is 6189. 6189 – 3000 = 3189 = 0xC75.

$>JI,21000380,20,1,04092019,01/01/1900,01/01/6189,6.0Aa01,0
Comparing the JI and JK Responses

**Example 1:**

In the following examples, the Date Code is shaded. JI query
date code example:

$>JI,311077,1,7,04102005,01/01/1900,01/01/3000, 6.8Hx, 46

JK query date code example:

$>JK,01/01/3000, 0, (1, 2, 5 or no number)

In the JK example the last two digits ('00') of the Date Code ('3000') represent the Hex Code (the second column of Table 2 above).

The last digit to the right (1, 2, 5 or no number) is the Downgrade Code...this is the output rate in Hertz indicating a
downgrade from the default of 10 Hz. So if 1, 2 or 5 does not appear (no number), the output rate is the default 10 Hz.

The Date Codes are identical in either query and are directly related to each other. Also, the last digit in the JK query is
the hexadecimal equivalent of the last two digits in the Date Code. The following example further illustrate this (Date Code
is shaded).

Note: The JI response provides the decimal Date Code while the JK response provides both the decimal Date Code and
the hex Date Code (the Hex Code).

**Example 2:**

$>JI,311077,1,7,04102005,01/01/1900,01/01/3015, 6.8Hx, 46

JK query date code example:

$>JK,01/01/3015, F

In this example the last two digits ('15') of the Date Code ('3015') is the decimal equivalent of the last value ('F'), which is
the Hex Code (see the last row in Table 1 above). Example shows no downgrade code.

Topic Last Updated: v4.0 / June 30, 2020
Ethernet Configuration

Some receivers have support for Ethernet. It is disabled by default but may be enabled with the $JETHERNET serial command.

Enabling and Disabling Ethernet

To start, the full current state of Ethernet configuration may be checked with the command "$JETHERNET". When ethernet is disabled, the following is displayed:

$JETHERNET
$>JETHERNET,MAC,8C-B7-F7-F0-00-01
$>JETHERNET,MODE,OFF
$>JETHERNET,PORTI,OFF
$>JETHERNET,PORTUDP,OFF
$>JETHERNET,NTRIPCLIENT,OFF
$>JETHERNET,IPADDRESS,NONE

To enable Ethernet, you first need to know if you are going to allow the receiver to be assigned an IP address automatically via DHCP, or statically assigned. If you are unsure, please contact the administrator of the network you wish to connect it to.

To enable Ethernet support with a DHCP-assigned IP address, simply use the command "$JETHERNET,MODE,DHCP". The receiver will attempt to get an address from the DHCP server on the network. You should be able to see the current IP address reported by a "$JETHERNET" query change.

To enable Ethernet support with a statically assigned IP address, use the command "$JETHERNET,MODE,STATIC,ip,subnet,gateway,dns" where ip/subnet/gateway/dns are each replaced with the relevant IP address. The gateway and dns parameters are optional, and only useful for allowing outgoing connections from the P328, which are not currently supported anyway. An example command would be "$JETHERNET,MODE,STATIC,192.168.0.42,255.255.255.0"

If one wishes to disable Ethernet use the command "$JETHERNET,MODE,OFF"

Enabling Network Services

With Ethernet enabled, it should be possible to send an ICMP ping to the receiver from a PC on the same network if one wishes to test that. No actual services are enabled on Ethernet by default however though, so to make practical use of Ethernet support, one must also enable a service.

As of the v6.0.0 firmware, the only services implemented the PORTI virtual serial port, PORTUDP, and NTRIPCLIENT. Additional types of network services may be implemented in future firmware versions.

For details regarding these services, please reference the relevant $JETHERNET,* command documentation for the service in question.

For sake of example, it is possible to enable the PORTI virtual serial port as a TCP server. Once a connection to it is made, it will act just like a local serial port of the receiver would. Only one TCP client may be connected to it at a time.

Important Note: Enabling PORTI as a TCP server should only be done when the network the receiver is connected to is considered to be a trusted network, since it gives full access to the receiver just as a local serial port would, and has no authentication mechanism.
To enable the PORTI service as a TCP server, use the command 
\texttt{\$JETHERNET,PORTI,\textit{port}} \ where \textit{port} \ is replaced with the TCP port number which one wishes to use. Any port in the range 1 to 65535 is allowable, but it is recommended one consider which TCP port numbers are typically reserved for various common protocols and avoid those port numbers.

To disable the PORTI service, use the command \texttt{\$JETHERNET,PORTI,OFF}.

As an additional note, when the connected to a network, the receiver can be accessed with a hostname of \texttt{hgnss\#\#\#\#\#\#\#\#\#} \ where \#\#\#\#\#\#\#\#\# \ is replaced with the receiver’s electronic serial number as is reported by the \$JI command. This can make it easier to connect to a receiver on a local network that was assigned an IP address by DHCP, so you do not need to check which IP address it was assigned.
Enabling Ethernet Services

With Ethernet enabled, it should be possible to send an ICMP ping to the P328 receiver from a PC on the same network, if one wishes to test that. No actual services are enabled on Ethernet by default however though, so to make practical use of Ethernet support, one must also enable a service.

As of the writing of this document, the only Ethernet service implemented is the PORTI virtual serial port. Additional types of Ethernet services may be implemented in future firmware versions.

The PORTI virtual serial port allows a listening TCP port to be opened, which will act just like a local serial port of the receiver would. Only one TCP client may be connected at a time.

**Important Note:** Enabling “PORTI” on Ethernet should only be done with the P328 connected to a trusted network, since it gives full access to the receiver just as a local serial port would, and has no authentication or security mechanisms.

To enable the PORTI service, use the command:

$JETHERNET,PORTI,port

where **port** is replaced with the TCP port number which one wishes to use. Any port in the range 1 to 65535 is allowable, but it is recommended one consider which TCP port numbers are typically reserved for various common protocols and avoid those port numbers.

To disable the PORTI service, use the command:

$JETHERNET,PORTI,OFF
